Definitions

Project Number: WMWBARAP_1417

Abbreviation	Description
DF	Dilution Factor
LCS	Lab Control Sample
LFM	Lab Fortified Matrix
MB	Method Blank
MDL	Method Detection Limit; minimum concentration of an analyte that can be determined with 99% confidence that the concentration is greater than zero.
MS	Matrix Spike
MSD	Matrix Spike Duplicate
Prec	Precision (% RPD)
Q	Qualifier; comment used to note deviations or additional information associated with analytical results.
QC	Quality Control
Rec	Recovery of Matrix Spike
RL	Reporting Limit; lowest concentration at which an analyte can be quantitatively measured.
Vio Spec	Violation Specification; regulatory limit which has been exceeded by the sample analyzed.

Qualifier	Description
A	Bicarbonate alkalinity, carbonate alkalinity, hydroxide alkalinity, free carbon dioxide, and/or total carbon dioxide calculations are estimates due to pH>10SU and/or TDS>500mg/L.
FA	Field results were reviewed by the Water Field Group. Refer to APC Field Case Narrative.
J	Reported value is an estimate because concentration is less than reporting limit.
RA	Matrix spike is invalid due to sample concentration.
U	Compound was analyzed, but not detected.

RE: Project: WMWBARAP_1417
Pace Project No.: 30616118

Dear Brooke Caton:

Enclosed are the analytical results for sample(s) received by the laboratory on August 17, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Skyler C. Richmond

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,
 without the written consent of Pace Analytical Services, LLC.

PROJECT NARRATIVE

Project: WMWBARAP_1417
Pace Project No.: 30616118

Method: EPA 9315
Description: 9315 Total Radium
Client: Alabama Power
Date: September 20, 2023

General Information:

54 samples were analyzed for EPA 9315 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:

All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

PROJECT NARRATIVE

Project: WMWBARAP_1417
Pace Project No.: 30616118

Method: EPA 9320
Description: 9320 Radium 228
Client: Alabama Power
Date: September 20, 2023

General Information:

54 samples were analyzed for EPA 9320 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:

All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

PROJECT NARRATIVE

Project: WMWBARAP_1417
Pace Project No.: 30616118

Method: Total Radium Calculation
Description: Total Radium 228+226
Client: Alabama Power
Date: September 20, 2023

General Information:

48 samples were analyzed for Total Radium Calculation by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:

All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

This data package has been reviewed for quality and completeness and is approved for release.

QUALIFIERS

Project: WMWBARAP_1417
Pace Project No.: 30616118

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Act - Activity

Unc - Uncertainty: For Safe Drinking Water Act (SDWA) analyses, the reported Unc. is the calculated Count Uncertainty (95% confidence interval) using a coverage factor of 1.96. For all other matrices (non-SDWA), the reported Unc. is the calculated Expanded Uncertainty (aka Combined Standard Uncertainty, CSU), reported at the 95% confidence interval using a coverage factor of 1.96.

Gamma Spec: The Unc. reported for all gamma-spectroscopy analyses (EPA 901.1), is the calculated Expanded Uncertainty (CSU) at the 95.4% confidence interval, using a coverage factor of 2.0.

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

GROUNDWATER STATS CONSULTING

June 27, 2023

Southern Company Services
Attn: Mr. Greg Dyer
3535 Colonnade Parkway
Birmingham, AL 35243

Re: Plant Barry Ash Pond
1st Semi-Annual Statistical Analysis – April 2023

Dear Mr. Dyer,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the statistical analysis of groundwater data for the April 2023 1st Semi-Annual sample event for Alabama Power Company's Plant Barry Ash Pond. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015) as well as with the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began at site for the CCR program in 2016. The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** BY-UP-MW-1, BY-UP-MW-2, BY-UP-MW-3, and BY-UP-MW-4
- **Downgradient wells:** BY-AP-MW-1, BY-AP-MW-2, BY-AP-MW-3, BY-AP-MW-4, BY-AP-MW-5, BY-AP-MW-6, BY-AP-MW-7, BY-AP-MW-8, BY-AP-MW-9, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, BY-AP-MW-13, BY-AP-MW-14, BY-AP-MW-15, and BY-AP-MW-16
- **Delineation wells:** BY-AP-MW-1V, BY-AP-MW-5V, BY-AP-MW-7V, BY-AP-MW-8V, BY-AP-MW-10V, BY-AP-MW-12V, BY-AP-MW-13V, BY-AP-MW-14V, BY-AP-MW-15V, BY-AP-MW-16V, BY-AP-MW-17H, BY-AP-MW-17V, BY-AP-MW-18H, BY-AP-MW-19H, BY-AP-MW-20H, BY-AP-MW-20V, BY-AP-MW-22H, BY-AP-MW-23H, BY-AP-MW-23V, BY-AP-MW-24H, BY-AP-MW-25H, and BY-AP-MW-25V

Data from delineation wells are included on time series and box plots but did not require formal statistics. Please note that delineation well BY-AP-MW-25V was previously identified as BY-AP-MW-25VM.

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was prepared according to the Statistical Analysis Plan approved by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance, and Senior Advisor to Groundwater Stats Consulting. The analysis was reviewed Andrew Collins, Project Manager of Groundwater Stats Consulting.

The CCR program consists of the following constituents:

Appendix III (Detection Monitoring) - boron, calcium, chloride, fluoride, pH, sulfate, and TDS

Appendix IV (Assessment Monitoring) - antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, mercury, molybdenum, selenium, and thallium

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of Appendix IV downgradient well/constituent pairs containing 100% non-detects follows this letter. For all constituents, a substitution of the most recent reporting limit is used for non-detect data. This generally gives the most conservative limit in each case.

Time series plots for Appendix III and IV parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Any flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. Summary tables of all flagged values follow this report (Figure C).

During the April 2020 background screening, Appendix III data at all wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method for Appendix III parameters based on analysis of the spatial variability of groundwater quality data among wells upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. A summary of the background screening is presented in a later section of this letter. Power curves are provided in this report to demonstrate that the selected statistical methods for Appendix III parameters comply with

the USEPA Unified Guidance. The EPA suggests that the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves are based on the following statistical methods and site/data characteristics:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan
- Interwell Prediction Limits with 1-of-2 resample plan
- # Background Samples (Intrawell): 12
- # Background Samples (Interwell): 79
- # Constituents: 7
- # Downgradient wells: 16

Summary of Statistical Methods – Appendix III Parameters

Based on the Statistical Analysis Plan, the following statistical methods are used to evaluate the Appendix III parameters:

- Intrawell prediction limits, combined with a 1-of-2 resample plan for pH and sulfate
- Interwell prediction limits, combined with a 1-of-2 resample plan for boron, calcium, chloride, fluoride, and TDS

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the annual false positive rate associated with parametric limits is fixed at 10% as recommended by the EPA Unified Guidance (2009), the false positive rate associated with nonparametric limits is not fixed and depends upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits as appropriate. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.

- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the intrawell case, data for all wells and constituents may be re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In the interwell case, prediction limits are updated with upgradient well data following each sampling event after screening for any new outliers. While not required for this report, in some cases, deselecting the earlier portion of data may be necessary prior to construction of limits so that resulting statistical limits are conservative (lower) from a regulatory perspective and capable of rapidly detecting changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Appendix III Background Screening – April 2020

Outlier Analysis

Background data through May 2019 for Appendix III parameters were screened for outliers using Tukey's test for outliers and/or visual screening, and identified outliers were flagged with "o" in the database and shown in a lighter font on the time series graphs and data pages. A list of flagged outliers is included with this report (Appendix C). Flagged values are excluded from background in the calculation of statistical limits in order to better represent background conditions and to produce limits that are conservative from a regulatory perspective. No seasonal patterns were visually apparent on any of the time series plots, and no seasonal adjustments were made.

Trend Tests

The Sen's Slope/Mann Kendall trend test was used to evaluate all data at each well to identify statistically significant increasing or decreasing trends. In the absence of suspected contamination, significant trending data are typically not included in the background used for construction of prediction limits. This step serves to reduce variation

in background and better represent current background conditions. The results of the trend analyses showed several statistically significant increasing and decreasing trends. However, the background time period is short, and all trends noted were relatively low in magnitude when compared to average concentrations; therefore, no adjustments were made to any of the records. Trend test results were included with the April 2020 screening report.

Appendix III – Evaluation of Statistical Approach

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells, which assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells are not representative of the current background data population; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter.

Based on the results of the screening and use of the ANOVA, intrawell limits were initially recommended for sulfate, and interwell methods were recommended for boron, calcium, chloride, fluoride, pH and TDS. However, as shown on the boxplots, the upgradient levels for pH are very low (acid) and are not representative of downgradient water quality. Therefore, intrawell limits were recommended for pH as well—unless or until a future study confirms that those low levels are representative of unimpacted downgradient conditions.

Appendix III Background Update – Fall 2021

Outlier Analysis

Proposed background data were reviewed to identify any newly suspected outliers, since the last background update described above, at all wells for pH and sulfate through May 2021 and at upgradient wells for boron, calcium, chloride, fluoride, and TDS through November 2021. Visual screening is used to identify potential outliers. When values are identified as outliers, these measurements are flagged with “o” and excluded to reduce variation, better represent background conditions, and provide limits that are conservative from a regulatory perspective. As mentioned above, flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as

well as in a lighter font on the accompanying data pages. During the background update, the highest values for sulfate among existing background data in wells BY-MW-AP-13 and BY-MW-AP-14 were flagged to construct statistical limits that are conservative (i.e., lower) from a regulatory perspective. Additionally, the highest values among compliance data for sulfate in wells BY-MW-AP-MW-5 and MW-AP-16 were flagged in order to incorporate only compliance data that were of similar concentrations to existing background data.

Mann-Whitney

For constituents requiring intrawell prediction limits, the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through May 2019 to compliance data through May 2021. When no statistically significant difference in medians between the two groups is found at a 99% confidence level, background data may be updated with newer compliance data. Statistically significant differences (either an increase or decrease in median concentrations) were found the following well/constituent pairs:

Increase:

- Sulfate: BY-AP-MW-1, BY-AP-MW-8, BY-AP-MW-11, BY-AP-MW-12, BY-AP-MW-13, BY-AP-MW-14

Decrease:

- pH: BY-UP-MW-3, BY-UP-MW-4, BY-AP-MW-6, BY-AP-MW-13, BY-AP-MW-14

Note that the Mann-Whitney could not test sulfate in wells BY-AP-MW-5 and BY-MW-AP-16 because a minimum of 4 compliance samples were not available. However, because the available compliance samples were similar in concentration to background measurements, the respective records were updated with more recent samples.

Typically, when the test concludes that the medians of the two groups are significantly different, particularly in the downgradient wells, the background data are not updated to include the newer data but will be reconsidered in the future. In studies such as the current one, in which at least one of the segments being compared is of short duration, the comparison is complicated by the fact that normal short-term variation may be mistaken for long-term change in medians.

Due to more recent data for pH in all wells being fairly similar to background and better representing the groundwater quality in the absence of suspected impacts from practices at the facility, these background data sets were updated. While the Mann-Whitney test did not identify statistically significant differences for sulfate at several wells, these records

were not updated with more recent data due to the observed increase in concentrations in more recent samples compared to background samples. The following records were not updated during the 2021 background update, and a summary follows this report (Background Date Ranges):

- Sulfate: BY-MW-AP-1, BY-MW-AP-8, BY-MW-AP-9, BY-MW-AP-10, BY-MW-AP-11, BY-MW-AP-12, and BY-MW-AP-13

Trend Tests

The Sen's Slope/Mann Kendall trend test was used to evaluate the entire record of data through October 2021 from upgradient wells for parameters utilizing interwell prediction limits. When statistically significant increasing trends are identified in upgradient wells, the earlier portion of data may be deselected prior to construction of interwell statistical limits if the trending data would result in statistical limits that are not conservative from a regulatory perspective. Statistically significant trends were identified for the following well/constituent pairs:

Increasing

- Calcium: BY-UP-MW-3 and BY-UP-MW-4
- Fluoride: BY-UP-MW-2
- TDS: BY-UP-MW-1, BY-UP-MW-2, and BY-UP-MW-4

Decreasing

- Chloride: BY-UP-MW-2

Although statistically significant trends were identified for the well/constituent pairs listed above, the magnitudes of the trends are marginal relative to the respective concentrations; therefore, no adjustments were required for these well/constituent pairs at this time. Additionally, concentrations among all upgradient wells remain similar to each other. Therefore, all data from upgradient wells were used to construct interwell prediction limits.

Evaluation of Appendix III Parameters – April 2023

Intrawell prediction limits were constructed for pH and sulfate using screened background data through May 2021 at each well. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs. A summary of flagged outliers follows this report (Figure C).

Intrawell limits constructed from screened background data from within each well serve to provide statistical limits that are representative of the background data population, and that will rapidly identify a change in more recent compliance data from within a given well. The April 2023 sample from the same well is compared to its respective background. This statistical method removes the element of variation from across wells and eliminates the chance of mistaking natural spatial variation for a release from the facility. Intrawell prediction limits combined with a 1-of-2 verification strategy were constructed for pH and sulfate (Figure D). Background data will be re-evaluated for updating background limits when a minimum of 4 compliance samples are available.

Interwell prediction limits combined with a 1-of-2 verification strategy were constructed for boron, calcium, chloride, fluoride, and TDS using upgradient well data through April 2023 (Figure E). Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The April 2023 sample from each downgradient well is compared to the background limit to determine whether initial exceedances are present.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When the resample confirms the initial exceedance, a statistically significant increase (SSI) is identified, and further research is required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If a resample falls within the statistical limit, the initial exceedance is considered to be a false positive result; therefore, no further action is necessary. Summary tables and complete graphical results for intrawell and interwell prediction limits may be found following this letter (Figures D and E, respectively, pages 16-20). Exceedances for both intrawell and interwell prediction limits were identified for the following well/constituent pairs:

Intrawell:

- pH: BY-AP-MW-2, BY-AP-MW-3, BY-AP-MW-7, BY-AP-MW-8, and BY-UP-MW-10
- Sulfate: BY-AP-MW-1, BY-AP-MW-5, BY-AP-MW-7, BY-AP-MW-8, BY-AP-MW-9, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, BY-AP-MW-13, BY-AP-MW-14, BY-AP-MW-15, and BY-AP-MW-16

Interwell:

- Boron: BY-AP-MW-1, BY-AP-MW-9, BY-AP-MW-10, and BY-AP-MW-16
- Calcium: BY-AP-MW-1, BY-AP-MW-4, BY-AP-MW-5, BY-AP-MW-7, BY-AP-MW-8, BY-AP-MW-9, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, BY-AP-MW-13, BY-AP-MW-14, BY-AP-MW-15, and BY-AP-MW-16

- Chloride: BY-AP-MW-1, BY-AP-MW-4, BY-AP-MW-5, BY-AP-MW-7, BY-AP-MW-8, BY-AP-MW-9, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, BY-AP-MW-13, BY-AP-MW-14, BY-AP-MW-15, and BY-AP-MW-16
- Fluoride: BY-AP-MW-7, BY-AP-MW-11, BY-AP-MW-13, BY-AP-MW-14, BY-AP-MW-15, and BY-AP-MW-16
- TDS: BY-AP-MW-1, BY-AP-MW-4, BY-AP-MW-5, BY-AP-MW-7, BY-AP-MW-8, BY-AP-MW-9, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, BY-AP-MW-13, BY-AP-MW-14, BY-AP-MW-15, and BY-AP-MW-16

When prediction limit exceedances are identified in downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test to determine whether concentrations are statistically increasing, decreasing, or stable at the 99% confidence level (Figure F). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Upgradient trends are an indication of variability in groundwater quality unrelated to practices at the site. A summary of the trend test results follows this letter (pages 21-23). Statistically significant trends were identified for the following well/constituent pairs:

Increasing:

- Boron: BY-AP-MW-10 and BY-AP-MW-16
- Calcium: BY-UP-MW-3, BY-UP-MW-4 (both upgradient), BY-AP-MW-7, BY-AP-MW-10, and BY-AP-MW-12
- Chloride: BY-AP-MW-7, BY-AP-MW-10, BY-AP-MW-12, BY-AP-MW-14, BY-AP-MW-15, and BY-AP-MW-16
- Fluoride: BY-UP-MW-1, BY-UP-MW-2, BY-UP-MW-3, BY-UP-MW-4 (all upgradient), BY-AP-MW-7, BY-AP-MW-13, and BY-AP-MW-16
- Sulfate: BY-AP-MW-1, BY-AP-MW-5, BY-AP-MW-7, BY-AP-MW-8, BY-AP-MW-9, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, BY-AP-MW-13, and BY-AP-MW-14
- TDS: BY-UP-MW-4 (upgradient) and BY-AP-MW-15

Decreasing:

- Calcium: BY-AP-MW-8
- Chloride: BY-UP-MW-2, BY-UP-MW-3, and BY-UP-MW-4 (all upgradient)
- pH: BY-UP-MW-2, BY-UP-MW-3, BY-UP-MW-4 (all upgradient), and BY-AP-MW-2

Evaluation of Appendix IV Parameters – April 2023

Data from upgradient wells for Appendix IV parameters were assessed for outliers during previous analyses. A summary of previously flagged outliers follows this report (Figure C).

In accordance with Alabama Department of Environmental Management (ADEM), the Groundwater Protections Standards (GWPS) were updated during the 2021 2nd semi-annual statistical analysis. The GWPS will be updated again during the 2023 2nd semi-annual statistical analysis. The methodology used to create these GWPS is described below.

Interwell Upper Tolerance Limits

First, background limits were determined using tolerance limits constructed from pooled upgradient well data through October 2021 (Figure G). The tolerance limits contain a known fraction (coverage) of the background population with a known level of confidence. The confidence and coverage levels for nonparametric tolerance limits are dependent upon the number of background samples. As requested by ADEM to eliminate variation among upgradient well data, nonparametric tolerance limits, which use the highest value in background as the statistical limit, were constructed. A summary of the upper tolerance limits follows this report (page 24).

Groundwater Protection Standards

These background limits were then compared to the Maximum Contaminant Levels (MCLs) for each parameter, and the higher of the two was used as the GWPS (Figure H, page 25) in the confidence interval comparisons described below.

Confidence Intervals

Confidence intervals were then constructed on downgradient wells using a maximum of the most recent 8 samples through April 2023 for each of the Appendix IV parameters (Figure I). These intervals were constructed as either parametric or nonparametric confidence intervals depending on the data distribution and percentage of non-detects. When data followed a normal or transformed-normal distribution, parametric confidence intervals were used for Appendix IV parameters. Nonparametric confidence intervals were constructed when data did not follow a normal or transformed-normal distribution or when there were greater than 50% non-detects. The lower confidence limit, which is constructed with 99% confidence for parametric confidence intervals, is compared to the

GWPS prepared as described above. The confidence level associated with nonparametric confidence intervals is dependent upon the number samples available.

As mentioned above, well/constituent pairs containing 100% non-detects did not require statistics and were, therefore, deselected prior to construction confidence intervals. A list of deselected well/constituent pairs also follows this report. Each confidence interval was compared with the corresponding GWPS. Only when the entire confidence interval is above the GWPS is the well/constituent pair considered to exceed its respective standard. Both a tabular summary and graphical presentation of the confidence interval results follow this letter (pages 26-28). Exceedances were identified for the following well/constituent pairs:

- Arsenic: BY-AP-MW-1, BY-AP-MW-5, BY-AP-MW-7, BY-AP-MW-8, BY-AP-MW-9, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, BY-AP-MW-14, BY-AP-MW-15, and BY-AP-MW-16
- Cobalt: BY-AP-MW-15

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Barry Ash Pond. If you have any questions or comments, please feel free to contact us.

Notes:

1. mg/L - Milligrams per liter
2. pCi/L - Picocuries per liter
3. The background limits were used as the groundwater protection standard (GWPS) when appropriate under 40 CFR §257.95(h), ADEM Rule 335-13-15-.06(h), and the ADEM Variance.
4. GWPS established during second semi-annual sampling event in 2021.

Prediction Limit Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 19 background values. Well-constituent pair annual alpha = 0.01928. Individual comparison alpha = 0.009664 (1 of 2).

Sanitas™ v.10.0.02 . UG
Hollow symbols indicate censored values.

Exceeds Limit: BY-AP-MW-1, BY-AP-MW-10, BY-AP-MW-16, BY-AP-MW-9

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 79 background values. 79.75% NDs. Annual per-constituent alpha = 0.009658. Individual comparison alpha = 0.0003032 (1 of 2). Comparing 16 points to limit.

Constituent: Boron, total Analysis Run 6/7/2023 12:08 AM View: All
Plant Barry Client: Southern Company Data: Barry Ash Pond

Sanitas™ v.10.0.02 . UG

Exceeds Limit: BY-AP-MW-1, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, BY-AP-MW-13, BY-AP-MW-14, BY-AP-MW-15...

Prediction Limit
Interwell Parametric

Background Data Summary: Mean=1.495, Std. Dev.=0.3096, n=80. Normality test: Shapiro Francia @alpha = 0.01, calculated = 0.9714, critical = 0.957. Kappa = 2.094 (c=7, w=16, 1 of 2, event alpha = 0.05132). Report alpha = 0.007498. Individual comparison alpha = 0.0004702. Comparing 16 points to limit.

Sanitas™ v.10.0.02 . UG

Exceeds Limit: BY-AP-MW-1, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, BY-AP-MW-13, BY-AP-MW-14, BY-AP-MW-15...

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 80 background values. Annual per-constituent alpha = 0.009386. Individual comparison alpha = 0.0002946 (1 of 2). Comparing 16 points to limit.

NP test selected by user. Limit is highest of 68 background values. 88.24% NDs. 93.55% coverage at alpha=0.01; 95.51% coverage at alpha=0.05; 99.02% coverage at alpha=0.5. Report alpha = 0.03056.

Constituent: Arsenic Analysis Run 1/19/2022 3:43 PM View: Appendix IV - UTLs
Plant Barry Client: Southern Company Data: Barry Ash Pond

Tolerance Limit Interwell Non-parametric

NP test selected by user. Limit is highest of 68 background values. 93.55% coverage at alpha=0.01; 95.51% coverage at alpha=0.05; 99.02% coverage at alpha=0.5. Report alpha = 0.03056.

Constituent: Barium Analysis Run 1/19/2022 3:43 PM View: Appendix IV - UTLs
Plant Barry Client: Southern Company Data: Barry Ash Pond

Tolerance Limit Interwell Non-parametric

NP test selected by user. Limit is highest of 66 background values. 93.94% NDs. 93.16% coverage at alpha=0.01; 95.51% coverage at alpha=0.05; 99.02% coverage at alpha=0.5. Report alpha = 0.03387.

Constituent: Beryllium Analysis Run 1/19/2022 3:43 PM View: Appendix IV - UTLs
Plant Barry Client: Southern Company Data: Barry Ash Pond

Tolerance Limit Interwell Non-parametric

NP test selected by user. Limit is highest of 68 background values. 98.53% NDs. 93.55% coverage at alpha=0.01; 95.51% coverage at alpha=0.05; 99.02% coverage at alpha=0.5. Report alpha = 0.03056.

Constituent: Cadmium Analysis Run 1/19/2022 3:43 PM View: Appendix IV - UTLs
Plant Barry Client: Southern Company Data: Barry Ash Pond

Tolerance Limit Interwell Non-parametric

NP test selected by user. Limit is highest of 68 background values. 83.82% NDs. 93.55% coverage at alpha=0.01; 95.51% coverage at alpha=0.05; 99.02% coverage at alpha=0.5. Report alpha = 0.03056.

Constituent: Chromium Analysis Run 1/19/2022 3:43 PM View: Appendix IV - UTLs
Plant Barry Client: Southern Company Data: Barry Ash Pond

Tolerance Limit Interwell Non-parametric

NP test selected by user. Limit is highest of 67 background values. 58.21% NDs. 93.16% coverage at alpha=0.01; 95.51% coverage at alpha=0.05; 99.02% coverage at alpha=0.5. Report alpha = 0.03217.

Constituent: Cobalt Analysis Run 1/19/2022 3:43 PM View: Appendix IV - UTLs
Plant Barry Client: Southern Company Data: Barry Ash Pond

Tolerance Limit Interwell Non-parametric

NP test selected by user. Limit is highest of 60 background values. 92.77% coverage at alpha=0.01; 95.12% coverage at alpha=0.05; 99.02% coverage at alpha=0.5. Report alpha = 0.04607.

Constituent: Combined Radium 226 + 228 Analysis Run 1/19/2022 3:43 PM View: Appendix IV - UTLs
Plant Barry Client: Southern Company Data: Barry Ash Pond

Tolerance Limit Interwell Non-parametric

NP test selected by user. Limit is highest of 72 background values. 52.78% NDs. 93.95% coverage at alpha=0.01; 95.9% coverage at alpha=0.05; 99.02% coverage at alpha=0.5. Report alpha = 0.02489.

Constituent: Fluoride, total Analysis Run 1/19/2022 3:43 PM View: Appendix IV - UTLs
Plant Barry Client: Southern Company Data: Barry Ash Pond

Tolerance Limit Interwell Non-parametric

NP test selected by user. Limit is highest of 68 background values. 89.71% NDs. 93.55% coverage at alpha=0.01; 95.51% coverage at alpha=0.05; 99.02% coverage at alpha=0.5. Report alpha = 0.03056.

Constituent: Lead Analysis Run 1/19/2022 3:43 PM View: Appendix IV - UTLs
Plant Barry Client: Southern Company Data: Barry Ash Pond

Tolerance Limit Interwell Non-parametric

NP test selected by user. All background values were censored; limit is most recent reporting limit. 93.55% coverage at alpha=0.01; 95.51% coverage at alpha=0.05; 99.02% coverage at alpha=0.5. Report alpha = 0.03056.

Constituent: Lithium Analysis Run 1/19/2022 3:43 PM View: Appendix IV - UTLs
Plant Barry Client: Southern Company Data: Barry Ash Pond

Tolerance Limit Interwell Non-parametric

NP test selected by user. All background values were censored; limit is most recent reporting limit. 93.55% coverage at alpha=0.01; 95.51% coverage at alpha=0.05; 99.02% coverage at alpha=0.5. Report alpha = 0.03056.

Constituent: Mercury Analysis Run 1/19/2022 3:43 PM View: Appendix IV - UTLs
Plant Barry Client: Southern Company Data: Barry Ash Pond

Tolerance Limit
Interwell Non-parametric

NP test selected by user. All background values were censored; limit is most recent reporting limit. 93.55% coverage at alpha=0.01; 95.51% coverage at alpha=0.05; 99.02% coverage at alpha=0.5. Report alpha = 0.03056.

Constituent: Molybdenum Analysis Run 1/19/2022 3:43 PM View: Appendix IV - UTLs
Plant Barry Client: Southern Company Data: Barry Ash Pond

Tolerance Limit
Interwell Non-parametric

NP test selected by user. Limit is highest of 68 background values. 98.53% NDs. 93.55% coverage at alpha=0.01; 95.51% coverage at alpha=0.05; 99.02% coverage at alpha=0.5. Report alpha = 0.03056.

Constituent: Selenium Analysis Run 1/19/2022 3:43 PM View: Appendix IV - UTLs
Plant Barry Client: Southern Company Data: Barry Ash Pond

Tolerance Limit
Interwell Non-parametric

NP test selected by user. All background values were censored; limit is most recent reporting limit. 93.55% coverage at alpha=0.01; 95.51% coverage at alpha=0.05; 99.02% coverage at alpha=0.5. Report alpha = 0.03056.

Constituent: Thallium Analysis Run 1/19/2022 3:43 PM View: Appendix IV - UTLs
Plant Barry Client: Southern Company Data: Barry Ash Pond

Selenium	mg/L	0.00102	0.05
Thallium	mg/L	0.0002	0.002

Notes:

1. mg/L - Milligrams per liter
2. pCi/L - Picocuries per liter
3. The background limits were used as the groundwater protection standard (GWPS) when appropriate under 40 CFR §257.95(h), ADEM Rule 335-13-15-.06(h), and the ADEM Variance.
4. GWPS established during second semi-annual sampling event in 2021.

GROUNDWATER STATS CONSULTING

October 23, 2023

Southern Company Services
Attn: Mr. Greg Budd
3535 Colonnade Parkway
Birmingham, AL 35243

Re: Plant Barry Ash Pond
Background Update & 2nd Semi-Annual Statistical Analysis – August 2023

Dear Mr. Budd,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the background update and statistical analysis of groundwater data for the August 2023 2nd Semi-Annual sample event for Alabama Power Company's Plant Barry Ash Pond. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015) as well as with the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began at site for the CCR program in 2016. The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** BY-UP-MW-1, BY-UP-MW-2, BY-UP-MW-3, and BY-UP-MW-4
- **Downgradient wells:** BY-AP-MW-1, BY-AP-MW-2, BY-AP-MW-3, BY-AP-MW-4, BY-AP-MW-5, BY-AP-MW-6, BY-AP-MW-7, BY-AP-MW-8, BY-AP-MW-9, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, BY-AP-MW-13, BY-AP-MW-14, BY-AP-MW-15, and BY-AP-MW-16
- **Delineation wells:** BY-AP-MW-1V, BY-AP-MW-5V, BY-AP-MW-7V, BY-AP-MW-8V, BY-AP-MW-10V, BY-AP-MW-12V, BY-AP-MW-13V, BY-AP-MW-14V, BY-AP-MW-15V, BY-AP-MW-16V, BY-AP-MW-17H, BY-AP-MW-17V, BY-AP-MW-18H, BY-AP-MW-19H, BY-AP-MW-20H, BY-AP-MW-20V, BY-AP-MW-22H, BY-AP-MW-23H, BY-AP-MW-23V, BY-AP-MW-24H, BY-AP-MW-25H, and BY-AP-MW-25V

Data from delineation wells are included on time series and box plots but did not require formal statistics. Please note that delineation well BY-AP-MW-25V was previously identified as BY-AP-MW-25VM.

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was prepared according to the Statistical Analysis Plan approved by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance, and Senior Advisor to Groundwater Stats Consulting. The analysis was reviewed by Andrew Collins, Project Manager for Groundwater Stats Consulting.

The CCR program consists of the following constituents:

Appendix III (Detection Monitoring) - boron, calcium, chloride, fluoride, pH, sulfate, and TDS

Appendix IV (Assessment Monitoring) - antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, mercury, molybdenum, selenium, and thallium

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of Appendix IV downgradient well/constituent pairs containing 100% non-detects follows this letter. For all constituents, a substitution of the most recent reporting limit is used for non-detect data. This generally gives the most conservative limit in each case. Due to historic varying detection limits, the following reporting limits were substituted across all wells:

- Arsenic: 0.000203 mg/L
- Cadmium: 0.000203 mg/L
- Chromium: 0.00102 mg/L
- Cobalt: 0.005 mg/L
- Lead: 0.000203 mg/L
- Selenium: 0.00102 mg/L

Time series plots for Appendix III and IV parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Any flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. Summary tables of all flagged values follow this report (Figure C).

During the April 2020 background screening, Appendix III data at all wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method for Appendix III parameters based on analysis of the spatial variability of groundwater quality data among wells upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. A summary of the background screening is presented in a later section of this letter. Power curves are provided in this report to demonstrate that the selected statistical methods for Appendix III parameters comply with the USEPA Unified Guidance. The EPA suggests that the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves are based on the following statistical methods and site/data characteristics:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan
- Interwell Prediction Limits with 1-of-2 resample plan
- # Background Samples (Intrawell): 12
- # Background Samples (Interwell): 84
- # Constituents: 7
- # Downgradient wells: 16

Summary of Statistical Methods – Appendix III Parameters

Based on the Statistical Analysis Plan, the following statistical methods are used to evaluate the Appendix III parameters:

- Intrawell prediction limits, combined with a 1-of-2 resample plan for pH and sulfate
- Interwell prediction limits, combined with a 1-of-2 resample plan for boron, calcium, chloride, fluoride, and TDS

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the annual false positive rate associated with parametric limits is fixed at 10% as recommended by the EPA Unified Guidance (2009), the false positive rate associated with nonparametric limits is not fixed and depends upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits as appropriate. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data for parametric limits. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the intrawell case, data for all wells and constituents may be re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In the interwell case, prediction limits are updated with upgradient well data following each sampling event after screening for any new outliers. In some cases, deselecting the earlier portion of data is necessary prior to construction of limits so that resulting statistical limits are representative of present-day groundwater quality conditions in the absence of suspected impacts as a result of practices from the facility. In other cases, the more recent portion of the record may be deselected if measurements are increasing and the cause is not known. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs. A summary of any truncated records follows this letter.

Summary of Background Update Appendix III Constituents – Fall 2023

Intrawell prediction limits, which compare the most recent compliance sample from a given well to historical data from the same well, are updated by testing for the appropriateness of consolidating new sampling observations with the screened background data. As discussed in the Statistical Analysis Plan (August 2020), intrawell prediction limits are used to evaluate pH and sulfate at all wells due to spatial variation for these parameters. Interwell prediction limits are used to compare the most recent sample from each downgradient well to statistical limits constructed from pooled upgradient well data for boron, calcium, chloride, fluoride, and TDS.

Outlier Analysis

Proposed background data were reviewed during this analysis to identify any newly suspected outliers since the last background update performed in the Fall 2021 at all wells for pH and sulfate through April 2023 and at upgradient wells for boron, calcium, chloride, fluoride, and TDS through August 2023. Visual screening and Tukey's outlier test are used to identify potential outliers.

Tukey's test identified outliers for pH, sulfate, chloride, and TDS (Figure C). However, the majority of these measurements appeared similar to remaining concentrations within each well and evident of spatial variation; therefore, the measurements were not flagged. Exceptions include the lowest measurements of pH in upgradient wells BY-UP-MW-1 and BY-UP-MW-2, which were considerably lower during the May 2022 sample event, and were flagged as outliers to reduce variation. Among the values identified for sulfate, only the highest measurements in wells BY-AP-MW-15 and BY-AP-MW-9 were flagged as outliers.

Additionally, previously flagged measurements and sulfate in wells BY-AP-MW-5, BY-AP-MW-13, BY-AP-MW-14, and BY-AP-MW-16 were unflagged as these measurements were similar to remaining measurements within each respective well. In the case of chloride in downgradient well BY-AP-MW-1, earlier measurements, which have no impact on the statistical limits, were unflagged as outliers since interwell methods constructed from pooled upgradient well data are used to construct prediction limits.

Although Tukey's test did not identify statistical outliers for the following well/constituent pairs, the highest measurements were flagged in order to construct statistical limits that are conservative (i.e., lower) from a regulatory perspective:

- Sulfate: BY-AP-MW-5, BY-AP-MW-7, BY-AP-MW-8, BY-AP-MW-11, and BY-AP-MW-13

Outliers are flagged with "o" and excluded to reduce variation, better represent background conditions, and provide limits that are conservative from a regulatory perspective. Flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. All flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages.

Intrawell Limits - Mann-Whitney

For constituents requiring intrawell prediction limits, the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through May 2021 to compliance data through April 2023 (Figure D). Previously truncated records for sulfate at wells BY-AP-MW-1, BY-AP-MW-8, BY-AP-MW-9, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, and BY-AP-MW-13 were compared background data sets through May 2019 to compliance data through April 2023. When no statistically significant difference in medians between the two groups is found at a 99% confidence level, background data may be updated with newer compliance data. Statistically significant differences (either an increase or decrease in median concentrations) were found the following well/constituent pairs:

Increase:

- Sulfate: BY-AP-MW-1, BY-AP-MW-7, BY-AP-MW-8, BY-AP-MW-9, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, BY-AP-MW-13, and BY-AP-MW-14

Decrease:

- pH: BY-AP-MW-2

Typically, when the test concludes that the medians of the two groups are significantly different, particularly in the downgradient wells, the background data are not updated to include the newer data but will be reconsidered in the future. In studies such as the current one, in which at least one of the segments being compared is of short duration, the comparison is complicated by the fact that normal short-term variation may be mistaken for long-term change in medians.

In the case of pH, more recent measurements at well BY-AP-MW-2 are fairly similar to historical measurements; therefore, this record was updated through April 2023.

For sulfate at wells BY-AP-MW-1, BY-AP-MW-8, BY-AP-MW-9, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, and BY-AP-MW-13, compliance measurements are elevated compared to historical levels; therefore, these records retained the previously truncated background through May 2019. Additionally, the records for wells BY-AP-MW-7 and BY-AP-MW-14 were not updated at this time due to increased medians in compliance data and will continue to use background data through May 2021.

If further investigation shows the more recent reported measurements are representative of naturally occurring groundwater quality, these records will be updated. That study is beyond the scope of this analysis.

Interwell Limits - Trend Tests

The Sen's Slope/Mann Kendall trend test was used to evaluate the entire record of data through August 2023 from upgradient wells for parameters utilizing interwell prediction limits (Figure E). When statistically significant increasing trends are identified in upgradient wells, the earlier portion of data may be deselected prior to construction of interwell statistical limits if the trending data would result in statistical limits that are not conservative from a regulatory perspective. Statistically significant trends were identified for the following well/constituent pairs:

Increasing

- Calcium: BY-UP-MW-3 and BY-UP-MW-4
- Fluoride: BY-UP-MW-1 and BY-UP-MW-2
- TDS: BY-UP-MW-4

Decreasing

- Chloride: BY-UP-MW-2, BY-UP-MW-3, and BY-UP-MW-4

Although statistically significant trends were identified for the well/constituent pairs listed above, the magnitudes of the trends are marginal relative to the respective concentrations. The statistically significant increasing trends identified at wells BY-UP-MW-1 and BY-UP-MW-2 resulted from historical low-level reported concentrations followed by nondetect measurements. Additionally, concentrations among all upgradient wells remain similar to each other. Therefore, no adjustments were required for these well/constituent pairs at this time. Therefore, all data from upgradient wells were used to construct interwell prediction limits.

Evaluation of Appendix III Parameters – August 2023

Prediction Limits

Intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed for pH and sulfate using screened background data through April 2023 at each well, except for those well/constituent pairs with truncated records (Figure F). Intrawell limits constructed from screened background data from within each well serve to provide statistical limits that are representative of the background data population, and that will rapidly identify a change in more recent compliance data from within a given well. The August 2023 sample from the same well is compared to its respective background. This statistical method removes the element of variation from across wells and eliminates the chance of mistaking natural spatial variation for a release from the facility.

Interwell prediction limits combined with a 1-of-2 verification strategy were constructed for boron, calcium, chloride, fluoride, and TDS using upgradient well data through August 2023 (Figure G). Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The August 2023 sample from each downgradient well is compared to the background limit to determine whether initial exceedances are present.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When the resample confirms the initial exceedance, a statistically significant increase (SSI) is identified, and further research is required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If a resample falls within the statistical limit, the initial exceedance is considered to be a false positive result; therefore, no further action is necessary. Summary tables and complete graphical results for intrawell and interwell prediction limits may be found following this letter. Exceedances for both intrawell and interwell prediction limits were identified for the following well/constituent pairs:

Intrawell:

- pH (lower limit): BY-AP-MW-1
- pH (upper limit): BY-AP-MW-3 and BY-AP-MW-8
- Sulfate: BY-AP-MW-7, BY-AP-MW-8, BY-AP-MW-9, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, BY-AP-MW-15, and BY-AP-MW-16

Interwell:

- Boron: BY-AP-MW-1, BY-AP-MW-9, BY-AP-MW-10, and BY-AP-MW-16
- Calcium: BY-AP-MW-1, BY-AP-MW-4, BY-AP-MW-5, BY-AP-MW-6, BY-AP-MW-7, BY-AP-MW-8, BY-AP-MW-9, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, BY-AP-MW-13, BY-AP-MW-14, BY-AP-MW-15, and BY-AP-MW-16
- Chloride: BY-AP-MW-1, BY-AP-MW-3, BY-AP-MW-4, BY-AP-MW-5, BY-AP-MW-7, BY-AP-MW-9, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, BY-AP-MW-13, BY-AP-MW-14, BY-AP-MW-15, and BY-AP-MW-16
- Fluoride: BY-AP-MW-7 and BY-AP-MW-15

- TDS: BY-AP-MW-1, BY-AP-MW-3, BY-AP-MW-4, BY-AP-MW-5, BY-AP-MW-7, BY-AP-MW-8, BY-AP-MW-9, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, BY-AP-MW-13, BY-AP-MW-14, BY-AP-MW-15, and BY-AP-MW-16

Trend Test Evaluation – Appendix III

When prediction limit exceedances are identified in downgradient wells, data are further evaluated using the Sen’s Slope/Mann Kendall trend test to determine whether concentrations are statistically increasing, decreasing, or stable at the 99% confidence level (Figure H). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Upgradient trends are an indication of variability in groundwater quality unrelated to practices at the site. A summary of the trend test results follows this letter. Statistically significant trends were identified for the following well/constituent pairs:

Increasing

- Boron: BY-AP-MW-10 and BY-AP-MW-16
- Calcium: BY-UP-MW-3, BY-UP-MW-4 (both upgradient), BY-AP-MW-10, and BY-AP-MW-12
- Chloride: BY-AP-MW-3, BY-AP-MW-7, BY-AP-MW-10, BY-AP-MW-12, BY-AP-MW-14, BY-AP-MW-15, and BY-AP-MW-16
- Fluoride: BY-UP-MW-1, BY-UP-MW-2, (both upgradient), and BY-AP-MW-7
- Sulfate: BY-AP-MW-7, BY-AP-MW-8, BY-AP-MW-9, BY-AP-MW-10, BY-AP-MW-11, and BY-AP-MW-12
- TDS: BY-UP-MW-4 (upgradient), BY-AP-MW-3, BY-AP-MW-11, BY-AP-MW-15, and BY-AP-MW-16

Decreasing

- Calcium: BY-AP-MW-8
- Chloride: BY-UP-MW-2, BY-UP-MW-3, and BY-UP-MW-4 (all upgradient), and BY-AP-MW-9
- pH: BY-UP-MW-2, BY-UP-MW-3, and BY-UP-MW-4 (all upgradient)

Evaluation of Appendix IV Parameters – August 2023

Prior to evaluating Appendix IV parameters, upgradient well data were screened through visual screening and Tukey’s outlier test for potential outliers and extreme trending

patterns that would lead to artificially elevated statistical limits. A discussion of those findings is provided below.

Tukey's outlier test on pooled upgradient well data for Appendix IV parameters through August 2023 did not identify any values as potential outliers; therefore, no additional values were flagged.

Additionally, downgradient well data through August 2023 were screened through visual screening using time series graphs. Since the downgradient well data are used to construct confidence intervals, a regulatory conservative approach is taken in that values that are marginally high relative to the rest of the data are retained unless there is particular justification for excluding them. Previously flagged values for cobalt in downgradient well BY-AP-MW-4 were unflagged as these measurements were similar to remaining measurements within each respective well. A summary of flagged outliers follows this report (Figure C).

Interwell Upper Tolerance Limits

Background limits were determined using tolerance limits constructed from pooled upgradient well data through August 2023 (Figure I). The tolerance limits contain a known fraction (coverage) of the background population with a known level of confidence. The confidence and coverage levels for nonparametric tolerance limits are dependent upon the number of background samples. As requested by ADEM to eliminate variation among upgradient well data, nonparametric tolerance limits, which use the highest measurement of screened background as the statistical limit, were constructed. A summary of the upper tolerance limits follows this report.

Groundwater Protection Standards

These background limits were then compared to the Maximum Contaminant Levels (MCLs) for each parameter, and the higher of the two was used as the GWPS (Figure J) in the confidence interval comparisons described below.

In accordance with Alabama Department of Environmental Management (ADEM), the Groundwater Protections Standards (GWPS) were updated during this 2023 2nd semi-annual statistical analysis. The GWPS will be updated again during the 2025 2nd semi-annual statistical analysis.

Confidence Intervals

Confidence intervals were then constructed on downgradient wells using a maximum of the most recent 8 samples through August 2023 for each of the Appendix IV parameters (Figure K). These intervals were constructed as either parametric or nonparametric confidence intervals depending on the data distribution and percentage of non-detects. Nonparametric confidence intervals, which use the highest and lowest values as interval limits when $n=8$, were constructed when data did not follow a normal or transformed-normal distribution or when there were greater than 50% non-detects. The lower confidence limit, which is constructed with 99% confidence for parametric confidence intervals, is compared to the GWPS prepared as described above. The confidence level associated with nonparametric confidence intervals is dependent upon the number samples available.

As mentioned above, well/constituent pairs containing 100% non-detects did not require statistics and were, therefore, deselected prior to construction confidence intervals. A list of deselected well/constituent pairs also follows this report. Each confidence interval was compared with the corresponding GWPS. Only when the entire confidence interval is above the GWPS is the well/constituent pair considered to exceed its respective standard. Both a tabular summary and graphical presentation of the confidence interval results follow this letter). Exceedances were identified for the following well/constituent pairs:

- Arsenic: BY-AP-MW-1, BY-AP-MW-5, BY-AP-MW-7, BY-AP-MW-8, BY-AP-MW-9, BY-AP-MW-10, BY-AP-MW-11, BY-AP-MW-12, BY-AP-MW-14, BY-AP-MW-15, and BY-AP-MW-16
- Cobalt: BY-AP-MW-15

Trend Test Evaluation – Appendix IV

When confidence interval exceedances are identified in downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test to determine whether concentrations are statistically increasing, decreasing, or stable at the 95% confidence level (Figure L). Utilizing the 95% confidence level for trend tests readily identifies significant trends and is more sensitive than the 99% confidence level without drastically increasing the false negative rate. Upgradient wells are included in the trend analyses for all parameters found to exceed their confidence interval in downgradient wells. When similar patterns exist upgradient of the site, it is an indication of variability in groundwater which may be unrelated to practices at the site. Statistically significant trends were identified for the following well/constituent pairs:

Increasing

- Arsenic: BY-AP-MW-5, BY-AP-MW-10, BY-AP-MW-14, BY-AP-MW-15, and BY-AP-MW-16
- Cobalt: BY-AP-MW-15

Decreasing

- Cobalt: BY-UP-MW-2, BY-UP-MW-3, and BY-UP-MW-4 (all upgradient)

Note that for upgradient wells BY-UP-MW-3 and BY-UP-MW-4, the slope is zero and represents the median of all pairwise slopes within each respective well.

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Barry Ash Pond. If you have any questions or comments, please feel free to contact us.

Notes:

1. mg/L - Milligrams per liter
2. pCi/L - Picocuries per liter
3. The background limits were used as the groundwater protection standard (GWPS) when appropriate under 40 CFR §257.95(h), ADEM Rule 335-13-15-.06(h), and the ADEM Variance.
4. GWPS established during second semi-annual sampling event in 2023.

Within Limits

Prediction Limit Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 23 background values. Well-constituent pair annual alpha = 0.01364. Individual comparison alpha = 0.006831 (1 of 2).

Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 21 background values. 19.05% NDs. Well-constituent pair annual alpha = 0.007982. Individual comparison alpha = 0.003999 (1 of 2).

Constituent: Sulfate as SO4 Analysis Run 10/22/2023 12:25 PM View: Intrawell PLs
Plant Barry Client: Southern Company Data: Barry Ash Pond

Exceeds Limit

Prediction Limit
Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.05 alpha level. Limit is highest of 16 background values. 37.5% NDs. Well-constituent pair annual alpha = 0.01287. Individual comparison alpha = 0.006456 (1 of 2).

Exceeds Limit: BY-AP-MW-1, BY-AP-MW-10, BY-AP-MW-16, BY-AP-MW-9

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 84 background values. 78.57% NDs. Annual per-constituent alpha = 0.008626. Individual comparison alpha = 0.0002707 (1 of 2). Comparing 16 points to limit.

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 84 background values. 9.524% NDs. Annual per-constituent alpha = 0.008626. Individual comparison alpha = 0.0002707 (1 of 2). Comparing 16 points to limit.

Analyte	Units	Background	GWPS
Antimony	mg/L	0.001015	0.006
Arsenic	mg/L	0.0017	0.01
Barium	mg/L	0.183	2
Beryllium	mg/L	0.001015	0.004
Cadmium	mg/L	0.000203	0.005
Chromium	mg/L	0.00604	0.1
Cobalt	mg/L	0.0157	0.0157
Combined Radium-226/228	pCi/L	3	5
Fluoride	mg/L	0.125	4
Lead	mg/L	0.00126	0.015
Lithium	mg/L	0.02	0.04
Mercury	mg/L	0.0005	0.002
Molybdenum	mg/L	0.01015	0.1
Selenium	mg/L	0.001015	0.05
Thallium	mg/L	0.000203	0.002

Notes:

1. mg/L - Milligrams per liter
2. pCi/L - Picocuries per liter
3. The background limits were used as the groundwater protection standard (GWPS) when appropriate under 40 CFR §257.95(h), ADEM Rule 335-13-15-.06(h), and the ADEM Variance.
4. GWPS established during second semi-annual sampling event in 2023.

Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 10/22/2023 1:29 PM View: Confidence Intervals
Plant Barry Client: Southern Company Data: Barry Ash Pond

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 10/22/2023 1:29 PM View: Confidence Intervals
Plant Barry Client: Southern Company Data: Barry Ash Pond

Non-Parametric Confidence Interval

Compliance Limit is not exceeded.

Constituent: Beryllium Analysis Run 10/22/2023 1:29 PM View: Confidence Intervals
Plant Barry Client: Southern Company Data: Barry Ash Pond

Non-Parametric Confidence Interval

Compliance Limit is not exceeded.

Constituent: Cadmium Analysis Run 10/22/2023 1:29 PM View: Confidence Intervals
Plant Barry Client: Southern Company Data: Barry Ash Pond

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Chromium Analysis Run 10/22/2023 1:29 PM View: Confidence Intervals
 Plant Barry Client: Southern Company Data: Barry Ash Pond

Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 10/22/2023 1:29 PM View: Confidence Intervals
 Plant Barry Client: Southern Company Data: Barry Ash Pond

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 10/22/2023 1:29 PM View: Confidence Intervals
 Plant Barry Client: Southern Company Data: Barry Ash Pond

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Fluoride, total Analysis Run 10/22/2023 1:29 PM View: Confidence Intervals
 Plant Barry Client: Southern Company Data: Barry Ash Pond

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lead Analysis Run 10/22/2023 1:29 PM View: Confidence Intervals
Plant Barry Client: Southern Company Data: Barry Ash Pond

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lithium Analysis Run 10/22/2023 1:29 PM View: Confidence Intervals
Plant Barry Client: Southern Company Data: Barry Ash Pond

Non-Parametric Confidence Interval

Compliance Limit is not exceeded.

Constituent: Molybdenum Analysis Run 10/22/2023 1:29 PM View: Confidence Intervals
Plant Barry Client: Southern Company Data: Barry Ash Pond

Non-Parametric Confidence Interval

Compliance Limit is not exceeded.

Constituent: Selenium Analysis Run 10/22/2023 1:29 PM View: Confidence Intervals
Plant Barry Client: Southern Company Data: Barry Ash Pond

Executive Summary

As described in the *Groundwater Remedy Selection Report* (Anchor QEA 2021a), geochemical manipulation via injections was selected as one corrective measure for arsenic and cobalt in groundwater at the James M. Barry Electric Generating Plant (Plant Barry) Ash Pond (Site) located in northeastern Mobile County, Alabama. Geochemical manipulation was selected because of its effectiveness, ease of implementation, versatility (ability to treat more than one constituent of interest [COI]), ability to implement in areas with limited working space, and because it produces no byproducts that would require further treatment or disposal. Treatability studies were performed to determine the optimum reagents and their doses and to provide information for the required underground injection control permit and design of the injection treatment at the Site.

Treatability studies for injection treatment (geochemical manipulation) at the Site consisted of the following steps:

- Sampling and characterization of aquifer soil and groundwater
- Batch tests, both screening and optimization
- Column tests, including treatment effectiveness and post-treatment leaching to determine stability
- Selective sequential extraction (SSE) on post-treatment soils

Aquifer soil and groundwater samples were collected from multiple areas, based on the number and concentrations of COIs, to help select areas for field pilot testing. Geochemical characterization of aquifer soils was performed to support the design and interpretation of the treatability testing. Homogenized soil samples were analyzed for the COIs (arsenic and cobalt), other Appendix IV parameters, iron, manganese, sulfide, fluoride, and total organic carbon. Extractable aluminum, iron, and manganese oxides, and cation exchange capacity in aquifer soils were also measured. Physical testing included percent moisture content and grain size distribution (gravel, sand, silt, and clay).

Groundwater samples were analyzed for major cations, anions, COIs and other Appendix III/IV parameters, and water quality parameters influencing the chemical behavior of the COIs. Prior to beginning treatability testing, confirmatory analysis of the COIs and dissolved iron and manganese concentrations was performed. Aquifer soil samples were paired with their respective groundwater samples based on their sampling location proximity. Those pairs were used throughout batch and column testing.

Based on previous successful treatability studies at other sites and geochemical studies performed as part of remedy selection (Anchor QEA 2021a), a series of batch tests was performed to determine the effectiveness and to rank the performance of the selected reagents in reducing the COI concentrations in Site groundwater and groundwater-soil slurries. All batch tests were conducted with the following two configurations: 1) groundwater batch tests; and 2) slurry batch tests. In

groundwater batch tests, reagents were added to test bottles filled with Site groundwater only. In slurry batch tests, the paired aquifer soils were mixed with the Site groundwaters to prepare slurries in test bottles, and then reagents were added to the test bottles. Slurry tests were performed because the aquifer solids could influence the performance of the tested reagents.

Four of the groundwater samples tested (BY-AP-MW-1, BY-AP-MW-8, BY-AP-MW-10, and BY-AP-MW-24H) contained arsenic as the sole COI. The groundwater collected at BY-AP-MW-15V had both arsenic and cobalt as COIs.

In the screening batch tests, 11 reagents and aeration were initially tested. More than one reagent effectively removed arsenic and cobalt from Site groundwater and slurries. Aeration generally removed arsenic though was unsuccessful in removing cobalt. Potassium permanganate (KMnO_4) and ferrous sulfate (FeSO_4) were two of the most promising reagents for removing both arsenic and cobalt in the screening batch tests. Optimization batch tests were conducted to determine the best pH buffering reagent and dose to achieve maximum arsenic and cobalt removal. The best removal of arsenic and cobalt was achieved using KMnO_4 buffered with sodium bicarbonate (NaHCO_3) and FeSO_4 buffered with NaHCO_3 and sodium carbonate (Na_2CO_3). The aeration treatment with a NaHCO_3 buffer did not lower arsenic concentrations to less than the groundwater protection standard (GWPS). The $\text{KMnO}_4 + \text{NaHCO}_3$ treatment was retained for column tests for the four arsenic-only groundwater samples. The $\text{KMnO}_4 + \text{NaHCO}_3$ and $\text{FeSO}_4 + \text{NaHCO}_3 + \text{Na}_2\text{CO}_3$ treatments were included in column tests for the groundwater containing both arsenic and cobalt as COIs.

Column tests were conducted to simulate injection applications of the selected reagent mixes and to evaluate the COI removal performance of aquifer soils treated with the selected reagent mixes under flow conditions. Column tests more closely simulate treatment under groundwater flow conditions than batch tests and provide information on removal efficiency, as well as capacity and the stability of the reagents under field conditions. Column test results were also used to provide data to support pilot test design and confirm the selected reagents will not inadvertently increase concentrations of other Appendix III/IV constituents above the GWPS due to, for example, release from the aquifer matrix. The two reagent mixes selected from the batch tests ($\text{KMnO}_4 + \text{NaHCO}_3$ and $\text{FeSO}_4 + \text{NaHCO}_3 + \text{Na}_2\text{CO}_3$) were mixed with aquifer soils to produce treated soils. Impacted groundwater was then run through the treated soils in columns to assess removal efficiency and capacity for treatment.

The $\text{KMnO}_4 + \text{NaHCO}_3$ reagent mix effectively removed arsenic from impacted groundwater during column studies, removing >94% of the influent mass. The $\text{KMnO}_4 + \text{NaHCO}_3$ reagent mix was more effective than $\text{FeSO}_4 + \text{NaHCO}_3 + \text{Na}_2\text{CO}_3$ at removing cobalt during the BY-AP-MW-15 column study. The $\text{KMnO}_4 + \text{NaHCO}_3$ reagent mix removed 96% of the influent mass, and the concentration was reduced to less than the GWPS for the duration of the study. The $\text{FeSO}_4 + \text{NaHCO}_3 + \text{Na}_2\text{CO}_3$

reagent mix lowered the arsenic concentration to less than the GWPS but did not achieve the GWPS for cobalt. Injection treatment is only one component of the remedy, as source control (consolidation and capping) and natural attenuation are also expected to reduce concentrations of COIs in groundwater (Anchor QEA 2021a).

After column studies were complete, Site background groundwater was run through the columns to determine the stability of each treatment. During this phase of testing, the COI concentrations in the effluents were lower than those from the previous treatment phase and decreased over time.

Therefore, treatment is expected to be stable, and Appendix III/IV constituents are not expected to be mobilized from aquifer soils by ambient groundwater flow after treatment.

Following completion of the column tests, the treated aquifer soils were tested to help evaluate the long-term stability of sequestered COIs using a five-step SSE procedure. In SSE, the treated aquifer soils are extracted by increasingly aggressive solutions formulated to target specific binding forms and help determine the mechanisms, strength of binding, and stability (or reversibility) of the COI uptake by host solids.

SSE results indicate that arsenic and cobalt are bound almost exclusively (>93%) in stable solid phases—specifically, through chemical bonding to, or incorporation into, metal oxides and hydroxides, such as iron and manganese oxides, and residual phases (dissolved only by concentrated strong acids). The associations with metal oxides and hydroxides were expected and indicate successful treatment, as the metals were major components of the treatment solutions. Less than 3% of arsenic and <7% of cobalt were in the water-soluble fraction of the treated soil solids.

Overall, the $\text{KMnO}_4 + \text{NaHCO}_3$ reagent mix effectively treated arsenic and cobalt in Site groundwater and is the recommended single-solution treatment for pilot-scale testing.

1 Introduction

As discussed in the *Groundwater Remedy Selection Report* (Anchor QEA 2021a), geochemical manipulation via injections was selected as one corrective measure for constituents of interest (COIs) at the James M. Barry Electric Generating Plant (Plant Barry) Ash Pond (Site) located in northeastern Mobile County, Alabama. COIs at the Site are arsenic and cobalt. Geochemical manipulation removes COIs from groundwater and immobilizes them in situ through the creation of solid precipitates formed from injection of treatment solutions (reagents). COIs adhere to the solid surfaces and are incorporated into the solid structures. Geochemical manipulation was selected because of its effectiveness, ease of implementation, versatility (ability to treat more than one COI), ability to implement in areas with limited working space, and because it produces no byproducts that would require further treatment or disposal. Before geochemical manipulation via injection treatment can be implemented, laboratory treatability studies need to be performed using the Site aquifer media (soil) and impacted groundwater.

The site-specific treatability studies discussed herein were conducted to evaluate reagent selection, dosing, and injection sequencing for in situ groundwater remediation. The treatability study approach includes the following:

- Sampling and characterization (analysis) of aquifer soil and groundwater
- Batch tests (screening batch tests, followed by optimization batch tests) to identify and rank reagents and reagent mixes for removal of COIs from Site groundwater
- Selection of the two best-performing reagents (or reagent mixes) for column testing to do the following:
 - Assess COI removal efficiency
 - Determine COI uptake capacity of reagent-treated aquifer soil to support pilot test design
- Confirm the selected reagents (or reagent mixes) will not inadvertently increase concentrations of other Appendix III/IV constituents above the groundwater protection standard (GWPS) due to, for example, release from the aquifer matrix.
- Determine the stability of each treatment by doing the following:
 - Running Site background groundwater through treated soils in the columns to assess potential for rerelease of COIs
 - Selective sequential extraction (SSE) of post-column-treated soil to provide information on the mechanisms and stability of COI sequestration

2 Selection of Reagents

Selection and formulation of reagents that can be injected to treat site-specific COIs were based on site-specific soil and groundwater geochemistry, previous Site work, and prior experience from successful treatability studies performed by Anchor QEA, for the same COIs at other sites for confidential clients. The *Monitored Natural Attenuation Demonstration* (Anchor QEA 2021b) documented key geochemical attenuation mechanisms occurring at the Site, including the following:

- Sorption on and/or coprecipitation with iron oxides and hydroxides for arsenic and cobalt
- Cation exchange on clay minerals for cobalt
- Potential precipitation of barium arsenate for arsenic (predicted by geochemical modeling)

Iron and manganese oxides are strong sorbents for many metals and metalloids, including arsenic (Dixit and Hering 2003; Manning et al. 2003; Mohan and Pittman 2007; Ouvard et al. 2002) and cobalt (Ainsworth et al. 1994). Subsurface geochemical conditions at the Site are generally favorable for formation of iron oxides. Therefore, the treatability studies were initially focused on reagents (or mixtures of reagents) with the potential to increase the abundance and stability of iron and/or manganese oxides and hydroxides in the subsurface. Based on Site conditions and treatability studies previously completed for other sites, the following reagent and reagent mixes were initially selected for treatability testing:

- Ferrous sulfate (FeSO_4)
- Ferric chloride (FeCl_3)
- CleanER-10 (injectable zero-valent iron)
- FerroBlack-Fe+ (FerroBlack; injectable iron sulfide)
- Potassium permanganate (KMnO_4)
- Ferrous sulfate and potassium permanganate ($\text{FeSO}_4 + \text{KMnO}_4$)
- Ferric chloride with potassium permanganate and manganese chloride ($\text{FeCl}_3 + \text{KMnO}_4 + \text{MnCl}_2$)
- Barium chloride (BaCl_2)
- Barium chloride and sodium sulfate (NaSO_4)
- Aeration
- KMnO_4 with pH adjusted to 9.5 (BY-AP-MW-15V only)
- FeSO_4 and KMnO_4 with pH adjusted to 9.5 (BY-AP-MW-15V only)
- FeCl_3 with KMnO_4 and MnCl_2 with pH adjusted to 9.5 (BY-AP-MW-15V only)

Soluble iron reagents such as FeSO_4 and FeCl_3 are acidic and form iron oxides/hydroxides such as ferrihydrite ($\text{Fe}(\text{OH})_3$) when neutralized. Iron oxides/hydroxides can adsorb and/or coprecipitate with arsenic and cobalt. Zero-valent iron, specifically CleanER-10, was tested because it oxidizes to form

iron oxides/hydroxides over time that can remove arsenic (Biterna et al. 2007) and heavy metals (Moraci and Calabrò 2010).

FerroBlack is a proprietary amendment from Redox Solutions. The active ingredient in FerroBlack is likely iron monosulfide, which immobilizes arsenic through adsorption at low arsenic concentrations and precipitation/mineralization of arsenic sulfides at higher arsenic concentrations (Niazi and Burton 2016). Cobalt is also likely to be removed through similar mechanisms by ferrous sulfide (FeS).

Permanganate has been widely used for in situ chemical oxidation. Permanganate reacts with soil components to produce manganese oxides, which can adsorb and incorporate COIs (Hou et al. 2017; Al Abdullah et al. 2016; Le and Phuc 2015).

Barium chloride was included in the reagent list because geochemical modeling indicated conditions were favorable for barium arsenate precipitation from groundwater. Increasing the dissolved barium concentration would, therefore, be expected to reduce arsenic concentrations.

Aeration was also included since Site groundwater generally contains high concentrations of dissolved iron (Section 3.1.2). Oxidation of dissolved iron by dissolved oxygen (DO) promotes iron oxide and hydroxide formation and COI removal.

The full list of reagents (or reagent mixes) tested and vendor sources is included in Table 1. The effectiveness of these treatments on COI removal was screened and evaluated through a series of batch tests. The most promising reagents (or reagent mixes) were selected for column testing.

3 Sampling and Initial Characterization

Groundwater samples and aquifer soils were collected from the Site for treatability testing conducted at the Anchor QEA Environmental Geochemistry Laboratory (EGL) in Portland, Oregon.

3.1 Groundwater

3.1.1 Sample Collection

Groundwater samples were collected by Alabama Power Company with support from Anchor QEA from wells BY-AP-MW-1, BY-AP-MW-8, BY-AP-MW-10, BY-AP-MW-15V, BY-AP-MW-15, and BY-AP-MW-24H (Figure 1). Five gallons of groundwater were collected from each well (except BY-AP-MW-15) on May 24 and November 2, 2022, for batch tests. An additional 10 gallons of groundwater from each well except BY-AP-MW-15V (plus an upgradient well BY-AP-MW-2) were collected on April 4, 2023, for column testing. Note that samples collected from BY-AP-MW-15V and BY-AP-MW-15 were used for the batch tests and column tests, respectively.

Prior to sampling, monitoring wells were purged until water quality parameters (pH, temperature, specific conductivity [SC], oxidation reduction potential [ORP], and DO) stabilized. Then, groundwater samples were collected in low-density polyethylene Cubitainers. Cubitainers were filled with zero headspace and packed in Mylar barrier bags containing oxygen-absorbent packets to minimize potential changes in redox conditions during transport to the EGL. Anaerobic conditions were maintained during sample handling at the EGL.

3.1.2 Sample Analysis and Results

Groundwater samples collected in the field were also sent directly to APC Environmental Laboratory (APCEL) in Calera, Alabama, and Pace Analytical Services, LLC and analyzed for major cations, anions, COIs, other Appendix III/IV parameters, and water quality parameters influencing the chemical behavior of the COIs (Table 2). Prior to commencing treatability testing at the EGL, groundwater samples in the received Cubitainers were subsampled and submitted to ALS Environmental in Kelso, Washington, for confirmatory analysis of COI and dissolved iron and manganese concentrations (Table 2). Laboratory analytical reports are included in Appendix A. Water quality parameters including pH, ORP, and DO were measured at the EGL and are provided in Table 2. Although almost all parameters were similar to the initial characterization results from groundwater samples sent directly from the field to APCEL, dissolved arsenic concentrations in BY-AP-MW-1, BY-AP-MW-8, BY-AP-MW-10, BY-AP-MW-15V, BY-AP-MW-15, and BY-AP-MW-24H decreased after the groundwater samples were shipped to the EGL. This is likely due to the high dissolved iron concentrations in groundwater samples. Despite the precautions taken to prevent oxidation, some precipitation of hydrous iron oxides in the sample containers had occurred during shipping as noted by the presence of orange-brown coloration on the inside surfaces of the Cubitainers upon receipt at the EGL.

Hydrous iron oxides are a strong sink for arsenic. Thus, groundwater samples used for batch and column testing were spiked with arsenic to ensure arsenic partitioning between groundwater and solids could be measured.

3.2 Aquifer Soils

3.2.1 Sample Collection

Aquifer soil samples were collected on March 1 and 2, 2022, from potential pilot test locations BY-AP-PT-1, BY-AP-PT-2, BY-AP-PT-3, and BY-AP-PT-5 at the Site (Figure 1). The aquifer soil samples were collected using sonic drilling technology from areas and depths where elevated concentrations of arsenic and cobalt have been identified and injection treatment will be implemented. The samples were selected in the field, packaged to preserve field redox conditions (airtight containers packed in Mylar bags with oxygen-absorbent packets), and shipped on ice to the EGL. Upon arrival at the EGL, aquifer soil samples were inspected and checked against the chain of custody and then stored under refrigeration until further processing.

3.2.2 Sample Analysis and Results

Geochemical characterization of aquifer soils was performed to support the design and interpretation of the treatability testing. Aquifer soil samples were composited and homogenized under a nitrogen atmosphere. The homogenized soil samples were subsampled and submitted to Apex Laboratories in Tigard, Oregon, for bulk chemical analyses, which include the COIs, arsenic and cobalt, other Appendix IV parameters, iron, manganese, sulfide, fluoride, and total organic carbon (Table 3). Extractable aluminum, iron, and manganese oxides and cation exchange capacity of aquifer soils were also measured (Tables 4 and 5) to characterize potential for intrinsic COI removal by soils and help with interpretation of batch test results.

Additional analyses included percent moisture content and grain size distribution (gravel, sand, silt, and clay; Table 6). Laboratory analytical reports are included in Appendix A. The surficial aquifer soil at the Site consists mostly of sand (92% to 99%), with minor silt and clay, and thus the surficial aquifer is hydraulically suitable for injection. Aquifer soil samples were paired with their respective groundwater samples based on their sampling location proximity. Those pairs were used throughout batch and column testing (Table 7). The concentrations of arsenic and cobalt were below detection in the aquifer soils selected for batch and column testing (Table 3). The concentrations of other Appendix IV constituents in the aquifer soils were very low or not detected (Table 3). Bulk iron concentrations of aquifer soils range from 518 to 1,250 milligrams per kilogram (mg/kg) (Table 3). Extractable iron oxides loosely correlate with bulk iron concentrations and account for 20% to 52% of iron in soils, indicating a variable but potentially significant intrinsic capacity of soils to remove COIs such as arsenic and cobalt.

4 Batch Tests

4.1 Methodology

A series of batch tests were performed to determine and rank the performance of the selected reagents in reducing the COI concentrations in Site groundwater. All batch tests were conducted with the following two configurations: 1) groundwater batch tests; and 2) groundwater-soil slurry batch tests. The slurry tests were included to assess the potential effect of the aquifer matrix on treatment effectiveness. In groundwater batch tests, reagents were added to test bottles filled with only Site groundwater. In slurry batch tests, the paired aquifer soils were mixed with the Site groundwater (Table 7) to prepare slurries in test bottles at a liquid-to-solid ratio of 10:1, then reagents were added to the test bottles. Control samples containing groundwater only, or groundwater plus aquifer soils for the slurry batch tests, were prepared for each groundwater to compare efficacy of the reagents. The performance of the reagents was evaluated in terms of the COI removal efficiency and the final COI concentrations relative to their GWPS.

The batch tests were divided into the following two stages: 1) screening batch tests to assess and compare the effectiveness of all the reagents to remove the COIs; and 2) optimization batch tests to improve performance of reagents retained from the screening batch tests by modifying reagent dose, combining reagents, and/or adjusting pH.

Except for aeration, the batch tests were performed under a nitrogen atmosphere in an anaerobic chamber to prevent changes in redox due to exposure to air. The general procedure for the batch tests is described in the following steps:

1. Test bottles were prepared in a controlled atmosphere glove box with 200 milliliters (mL) of groundwater or slurries of 200 mL of groundwater and 20 grams of aquifer soil (dry weight basis) for a liquid-to-solid ratio of 10:1. The initial arsenic concentrations in all the Site groundwater as received at the EGL were generally lower than expected based on historical data. This was attributed to the partial oxidation of dissolved iron in the groundwaters (present at much higher concentrations than arsenic) and precipitation of iron oxides, which removed dissolved arsenic. The Site groundwater samples were spiked with arsenic to provide initial arsenic concentrations to enable evaluation of treatment performance for arsenic. An arsenic stock solution was prepared from sodium arsenate heptahydrate ($\text{Na}_2\text{HAsO}_4 \cdot 7\text{H}_2\text{O}$) and used to spike the Site groundwater used for the batch tests. The target spiked dissolved arsenic concentration was 500 micrograms per liter ($\mu\text{g/L}$). Spiking of cobalt was not necessary because the initial cobalt concentrations were consistent with historical data.
2. Reagents or reagent mixes were added to the test bottles at a predetermined dose based on groundwater chemistry and previous successful treatability studies at other sites. The reagents are presented in Table 8. Controls without any reagent were also prepared for each groundwater

and slurry. The test bottles were sealed in Mylar bags with oxygen-absorbent packets and placed on a shaker table for 7 days. The aeration test bottles were placed on the countertop with caps open for 7 days.

3. Supernatants were collected from the test bottles at the end of the reaction period, filtered using 0.45-micron polyethersulfone syringe filters, and preserved with nitric acid. The filtered water samples were submitted to ALS Environmental and analyzed for dissolved COIs by U.S. Environmental Protection Agency (USEPA) Method 200.8 (inductively coupled plasma mass spectrometry). Water quality parameters including pH, ORP, and SC were also measured at the time of collection.
4. The solid fractions from each test jar were recovered and archived for possible future characterization.

4.2 Screening Batch Test Results

Tables 9 and 10 and Figures 2 through 8 show the results of the screening batch tests, specifically the following:

- Arsenic: All reagents and aeration generally reduced dissolved arsenic concentrations in groundwater. Five of the reagents/mixes, KMnO_4 , $\text{FeSO}_4 + \text{KMnO}_4$, $\text{BaCl}_2 + \text{NaSO}_4$, CleanER-10, and FerroBlack decreased arsenic concentrations to less than the GWPS in all groundwaters tested ($10 \mu\text{g/L}$; Tables 9 and 10). FeSO_4 , FeCl_3 , and BaCl_2 resulted in varied decreases in arsenic concentrations, and the GWPS was not reached using these reagents in BY-AP-MW-15V, BY-AP-MW-8, and BY-AP-MW-24H, respectively.
- Cobalt: Cobalt is a COI in BY-AP-MW-15V. KMnO_4 , KMnO_4 at pH 9.5, $\text{FeSO}_4 + \text{KMnO}_4$ at pH 9.5, $\text{FeCl}_3 + \text{KMnO}_4 + \text{MnCl}_2$ at pH 9.5, and FerroBlack reduced cobalt concentrations to less than the GWPS (Figures 5 and 8).

Laboratory analytical reports are included in Appendix A.

4.3 Optimization Batch Tests

In the screening batch tests, KMnO_4 , FeSO_4 , $\text{FeSO}_4 + \text{KMnO}_4$ at pH 9.5, and FerroBlack effectively removed arsenic and cobalt from Site groundwater and slurries. Optimization tests included increasing doses of selected reagents and including different pH buffering reagents. Although FerroBlack was effective for arsenic and cobalt removal in the screening batch test, it was not selected for further testing because of potential concern for increasing molybdenum concentrations in groundwater, as was observed in other treatability studies. Based on the screening batch test results and previous treatability studies performed by Anchor QEA for other coal combustion

residuals sites, the following reagents were selected and tested to achieve better arsenic and cobalt removal:

- KMnO_4
- FeSO_4
- Aeration

The three reagents (including aeration) were tested with addition of sodium bicarbonate (NaHCO_3) and sodium carbonate (Na_2CO_3) to buffer the final pH for higher cobalt removal than was achieved in the screening batch test. KMnO_4 was tested at three different (i.e., low, intermediate, and high) doses, with the high dose being approximately four times higher than low dose, in combination with two buffers, NaHCO_3 (Buffer 1) and $\text{NaHCO}_3 + \text{Na}_2\text{CO}_3$ (Buffer 2). FeSO_4 was tested with Buffer 1 and Buffer 2, which were implemented as two-solution treatments. Aeration with Buffer 1 was the final treatment tested. These treatments are summarized in Table 11.

Results of the optimization batch tests are summarized in Figures 9 through 13, the data are provided in Table 12, and the laboratory analytical reports are included in Appendix A. Table 13 summarizes the performance of all tested treatments to remove the COIs from Site groundwater and groundwater-soil slurries. Overall, the three tested reagents plus buffer(s) effectively reduced arsenic and cobalt concentrations in Site groundwater and slurries, although their performance varied slightly in different groundwater samples and slurries. $\text{KMnO}_4 + \text{Buffer 1}$ and $\text{FeSO}_4 + \text{Buffer 2}$ both decreased the arsenic and cobalt concentrations to below the GWPS, and $\text{KMnO}_4 + \text{Buffer 1}$ achieved the lowest arsenic and cobalt concentrations overall. Aeration + Buffer 1 achieved the GWPS for arsenic in BY-AP-MW-1 only and for cobalt in BY-AP-MW-15V. Adding buffers improved cobalt removal as the solubility of cobalt decreases with increasing pH. However, a higher pH increases arsenic solubility. Thus, buffer addition slightly reduced the effectiveness of FeSO_4 and aeration in removing arsenic from solution. The $\text{KMnO}_4 + \text{Buffer 1}$ (NaHCO_3) treatment was able to maximize both cobalt and arsenic removal.

Based on the optimization batch test results, the $\text{KMnO}_4 + \text{NaHCO}_3$ reagent mix was selected for column testing using all groundwater samples. The $\text{FeSO}_4 + \text{NaHCO}_3 + \text{Na}_2\text{CO}_3$ mix was selected for column testing using groundwater BY-AP-MW-15 that contained both arsenic and cobalt COIs.

5 Column Tests

Column tests were conducted to simulate injection applications and to evaluate the COI removal performance of aquifer soils treated with selected reagents under flow conditions. Column tests simulate treatment under groundwater flow conditions better than batch tests because they provide information on removal efficiency, capacity, and stability. Column test results can also confirm whether selected reagents will inadvertently increase concentrations of Appendix III/IV constituents above the GWPS, for example, due to release from the aquifer matrix.

5.1 Methodology

A total of six column tests were performed; the five groundwater samples were used as the column influents, and six treated soil columns were prepared for the Site groundwater samples (two different reagent-treated soils received BY-AP-MW-15 influent groundwater). A summary of the column test setup is provided in Table 14.

The initial arsenic concentrations in the Site groundwater samples collected for column testing were lower than expected based on historical data (Table 2). The groundwater samples in the influent reservoirs were, therefore, spiked with arsenic. An arsenic stock solution was prepared from $\text{Na}_2\text{HAsO}_4 \cdot 7\text{H}_2\text{O}$ and added to the influent reservoirs of BY-AP-MW-1, BY-AP-MW-8, BY-AP-MW-10, BY-AP-MW-15, and BY-AP-MW-24H to produce influent concentrations of approximately 1000 $\mu\text{g/L}$.

The two best-performing reagents selected from the batch tests were KMnO_4 and FeSO_4 , with pH buffer. $\text{KMnO}_4 + \text{NaHCO}_3$ was prepared by mixing the reagents in deionized water to create a stock solution. Stock solution $\text{KMnO}_4 + \text{NaHCO}_3$ (single-solution treatment) was mixed with the aquifer soils to produce $\text{KMnO}_4 + \text{NaHCO}_3$ treated soils. The dose of $\text{KMnO}_4 + \text{NaHCO}_3$ was determined by soil oxidant demand and dissolved iron concentrations in groundwater. FeSO_4 and the pH buffer were prepared separately (two-solution treatment) to avoid precipitation of iron oxides prior to injection into the aquifer soils to produce treated soils. The FeSO_4 dose was determined by targeting a molar (M) ratio of approximately 1:100 arsenic to iron. Bulk chemical composition data of technical-grade KMnO_4 , FeSO_4 , NaHCO_3 , and Na_2CO_3 were not collected before the column testing but will be tested prior to field injection. Since other Appendix IV constituents in the aquifer soils were very low (Table 3), only dissolved concentrations of arsenic, cobalt, iron, and manganese were analyzed.

These reagent mixes were mixed with aquifer soils to produce treated soils that were packed into columns. The treated soils were packed into 22-centimeter (cm)-long, 4.2-cm-diameter polypropylene columns to achieve a total depth (length) of 22 cm. Impacted groundwater was then run through the treated soil columns to assess removal efficiency and capacity for treatment.

The Site groundwater containing the COIs was pumped in an upflow direction through the columns at a constant flow rate of approximately 0.8 mL per minute for up to 60 pore volumes (PVs) using a peristaltic pump with a multichannel pump head. Flow rates were regularly checked and adjusted as needed to maintain a constant flow rate. During the column test, the average flow rate in the effluent samples was 0.65 mL per minute. Table 15 provides a summary of the column test operating conditions. The laboratory column apparatus is shown in Figure 14, and a detailed schematic is provided in Figure 15.

The laboratory column tests were operated at a higher linear velocity (67.1 cm per day) than the groundwater flow conditions in the vicinity of the Site, which is 0.40 cm per day (SCS 2023). As a result, the hydraulic residence time in the columns was shorter than the hydraulic residence time expected in the field, where longer residence times may be expected to result in greater extent of removal. The attenuation measured in the columns, therefore, provides a conservative estimate of the COI removal in the field.

Column influent and effluent solutions were sampled periodically (two to three times a day for the duration of the column test), and water quality parameters including pH, ORP, and SC were measured at the EGL. The cumulative flow volume was also recorded at the time of sampling and used to calculate the total number of PVs treated. Column influent and effluent samples were filtered using 0.45-micron polyethersulfone syringe filters and preserved with nitric acid. The samples were submitted to ALS Environmental for analysis of dissolved arsenic and cobalt and treatment reagent constituents, including iron and manganese.

After treatment-phase column tests were complete, Site background groundwater (BY-AP-MW-2) was run through the columns to determine the stability of each treatment. The column was run at a constant flow rate for approximately 20 to 30 PVs, and column influents and effluents were sampled at intervals. Samples were analyzed for dissolved COIs and constituents of the treatment reagents used (e.g., iron, manganese, and sulfate). These samples were not analyzed for other Appendix III/IV constituents because they were not detected or present at very low levels in Site soils used for the column tests (Table 3).

In addition, following completion of the column tests, the treated aquifer soils were tested to help evaluate the long-term stability of sequestered COIs using a five-step SSE procedure. In SSE, the treated aquifer soils are extracted by increasingly aggressive solutions formulated to target specific binding forms and help determine the mechanisms, strength of binding, and stability (or reversibility) of the COI uptake by host solids.

5.2 Column Test Results

Column test results are included in Table 16 and Appendix A. Influent and effluent concentrations of the COIs for the five Site groundwater samples are also shown in Figures 16 through 20. The cumulative COI mass uptake of the six treated soils in the columns are also plotted against the cumulative COI mass loading in Figures 21 and 22 for arsenic and cobalt, respectively.

Arsenic concentrations in the influent reservoirs were not stable and decreased over time, despite spiking of dissolved arsenic at 1,000 µg/L (Figures 16 through 20). Although the influent reservoirs were purged with nitrogen (N₂) and kept in sealed Mylar bags with oxygen-absorbing packets during the column tests, orange-brown iron oxide precipitates were observed to form inside the influent reservoirs over time, likely due to ongoing slow iron oxidation under anaerobic conditions. The dissolved arsenic concentrations in the BY-AP-MW-1, BY-AP-MW-10, and BY-AP-MW-24H influent reservoirs ranged from slightly above to lower than the GWPS throughout the column test (Figures 16, 18, and 20). The effluent solutions of these KMnO₄ + NaHCO₃-treated columns all contained arsenic concentrations lower than the corresponding influent solutions and GWPS. Dissolved arsenic concentrations in the BY-AP-MW-15 groundwater reservoir were above or near the GWPS for the first approximately 10 to 20 PVs of column flow for the two treated aquifer soil columns, and the effluent solutions contained arsenic concentrations lower than the GWPS (Figure 19). Dissolved arsenic concentrations in the BY-AP-MW-8 groundwater reservoir remained above approximately 640 µg/L for the duration of the column study (Figure 17). The KMnO₄ + NaHCO₃-treated column achieved >96% removal of the influent mass of arsenic for approximately 10 PVs, corresponding to approximately 3 mg/kg arsenic uptake capacity in the treated soils (Figures 17 and 21). Due to the arsenic depletion in BY-AP-MW-1, BY-AP-MW-10, BY-AP-MW-15, and BY-AP-MW-24H influent reservoirs, arsenic uptake capacity could not be estimated for these locations.

Cobalt concentrations in the BY-AP-MW-15 groundwater reservoir were greater than approximately 80 µg/L for the duration of the column study (Figure 19). The KMnO₄ + NaHCO₃-treated column achieved >96% removal of the influent mass of cobalt throughout the duration of the test (approximately 66 PVs; Figures 19 and 22). In contrast, the FeSO₄ + NaHCO₃ + Na₂CO₃-treated column achieved only approximately 50% to 60% removal of the influent mass of cobalt through 7 PVs and decreased to 24% removal by 70 PVs (Figures 19 and 22).

Overall, the KMnO₄ + NaHCO₃ treatment was most effective and successfully removed both arsenic and cobalt from Site groundwater based on the column studies.

6 Mechanisms and Stability of Treatment

Mechanisms and stability of treatment were assessed by flushing the columns with background groundwater and performing SSE on solids recovered from the columns at the end of the tests.

6.1 Column Tests to Assess Treatment Stability

Following completion of the column tests using impacted groundwater, the column influents were switched to background groundwater (BY-AP-MW-2) to assess the reversibility of the COI removal by the treated soils. Background groundwater was run through the columns for up to approximately 30 PVs. During this flushing phase of the column test, the measured COI concentrations in the effluents indicate the stability of the treatments were not reversible. In the $\text{KMnO}_4 + \text{NaHCO}_3$ -treated BY-AP-MW-15 column, arsenic and cobalt concentrations in the effluent remained below the GWPS for both the treatment and flushing phases of the column tests, indicating the treatment was not reversible. Similarly, in the $\text{KMnO}_4 + \text{NaHCO}_3$ -treated BY-AP-MW-8 column, the arsenic concentrations in the effluent from the flushing-phase test were comparable to those in the effluent during the first 10 PVs of treatment, indicating the treatment was not reversible. These results demonstrate the irreversibility of COI treatment by the $\text{KMnO}_4 + \text{NaHCO}_3$ single-solution treatment. Column test results for the flushing phase are included in Table 17 and Appendix A.

6.2 SSE on Post-Column Aquifer Soils

SSE quantifies the distribution of the sequestered COIs among different solid phases in the treated and COI-loaded aquifer soils. SSE results provide insights into the COI removal mechanisms, potential for remobilization of COIs, and long-term stability of the sequestered COIs. Specifically, SSE categorizes the target constituents into five operationally defined fractions, F1 through F5, which require increasingly aggressive chemical reagents to extract. The chemical extractions and what they represent are as follows:

Fraction No.	Fraction Name	Extraction Fluid	Targeted Phases
F1	Soluble	1 M magnesium chloride adjusted to pH 7	Dissolved and weakly sorbed
F2	Exchangeable	1 M monosodium phosphate at pH 5	Strongly sorbed, e.g., on clay minerals and iron compounds
F3	Reducible	0.1 M hydroxylamine/hydrochloric acid adjusted to pH 2 with nitric acid	Poorly crystalline metal oxides such as iron and manganese oxides
F4	Strong acid/oxidizable	16 M nitric acid	Crystalline oxide and crystalline sulfide minerals
F5	Residual	Digestion by USEPA Method 3050B	Relict silicate phases from the aquifer matrix

SSE was performed in accordance with the EGL standard operating procedure modified from Tessier et al. (1979). First, the bottom 6 cm of treated soil in the column was recovered and thoroughly homogenized under a nitrogen atmosphere in an anaerobic glove box. Approximately 1 gram (dry weight) of the recovered column media was weighed into a 50-mL centrifuge tube and extracted with the solutions in sequence described above. SSE was only performed on BY-AP-MW-8 and BY-AP-MW-15 solids, as these columns contained the highest arsenic concentrations in the influent, and BY-AP-MW-15 contained both arsenic and cobalt as COIs.

The SSE results are summarized in Figures 23 through 26 and Table 18; the analytical data are included in Appendix A. SSE results indicate arsenic and cobalt are almost completely (94% to $\geq 98\%$) associated with F2 through F5 fractions. Arsenic was present mostly in F2 and F4 in the BY-AP-MW-15 column solids, on which a low mass of arsenic was loaded (Figure 23). The column solids for BY-AP-MW-8 had a similar amount of arsenic in F4 as was measured for BY-AP-MW-15 column solids. However, the BY-AP-MW-8 column solids had higher masses of arsenic in F2 and F3, suggesting most of the groundwater arsenic accumulated in these two fractions. The F2 and F3 fractions include arsenic strongly adsorbed to and incorporated in iron and manganese oxides (Figures 25 and 26). The mass balance of arsenic in the BY-AP-MW-8 $\text{KMnO}_4 + \text{NaHCO}_3$ -treated column indicates approximately 3 mg/kg of arsenic was removed (Figure 21), whereas the sum of fractions is higher (approximately 6 mg/kg; Figure 23). The difference in solid-phase concentrations results from the arsenic preferentially accumulating at the inlet of the column (where samples were retrieved for SSE analysis).

The $\text{KMnO}_4 + \text{NaHCO}_3$ treatment and the $\text{FeSO}_4 + \text{NaHCO}_3 + \text{Na}_2\text{CO}_3$ treatment accumulated approximately 0.9 and approximately 0.2 mg/kg of cobalt in the BY-AP-MW-15 column solids, respectively (Figure 22). The masses of cobalt in F4 and F5 are similar for the treated columns, whereas the masses of cobalt in F2 and F3 are higher for the $\text{KMnO}_4 + \text{NaHCO}_3$ -treated column, suggesting cobalt is strongly adsorbed to and incorporated in iron and manganese oxides (Figures 25 and 26).

Overall, the strong association of arsenic and cobalt with iron and manganese oxides was expected and indicates successful treatment, as iron and manganese were major components of the treatment reagent mixes. The SSE results corroborate the column test flushing-phase results, showing stability of the COIs within the treated soils.

7 Conclusions and Recommendations

Batch and column tests were performed to evaluate the effectiveness of reagents and reagent mixes in removing the COIs (i.e., arsenic and cobalt) from Site groundwater. Performance criteria evaluated included the COI removal efficiency, treatment capacity, stability of the sequestered COIs, and potential for unintended consequences such as release of Appendix III/IV constituents from the aquifer matrix. Major conclusions of the treatability studies are as follows:

- The $\text{KMnO}_4 + \text{NaHCO}_3$ reagent mix performed well for arsenic and cobalt removal in batch tests.
- The GWPS was achieved for both arsenic and cobalt during column tests. Column test results showed >95% removal of arsenic and cobalt mass in the groundwater is achievable with the $\text{KMnO}_4 + \text{NaHCO}_3$ treatment for ≥ 10 PVs.
- After column studies using impacted groundwater were complete, Site background groundwater was pumped through the columns to determine the reversibility of treatment. These effluent concentrations were similar to or lower than effluent concentrations measured for the PVs of successful treatment, indicating treatment is not reversible under Site conditions.
- Following completion of the column tests, the column media (aquifer soils) were recovered to evaluate the long-term stability of sequestered COIs to remobilization using a five-step SSE procedure. SSE results indicate arsenic and cobalt are associated with and bound to manganese and iron oxide phases formed by the treatment.

Recommendations based on the laboratory treatability studies are as follows:

- Test $\text{KMnO}_4 + \text{NaHCO}_3$ single-solution reagent mix in injection field pilot studies at the Site where arsenic or arsenic plus cobalt are COIs in groundwater.
- Following selection of pilot locations and prior to implementation of field pilot tests, groundwater chemistry data should be reviewed, especially if a pilot test location is at a different location than that of the wells tested in this laboratory treatability study. If significant differences in groundwater chemistry are identified, confirmatory batch testing is recommended to confirm treatment performance and, if necessary, adjust the proposed injection reagent mix.

Tables

Table 1
Reagents Tested and Vendor Sources

No.	Reagent Tested	Abbreviation	Vendor	Notes
1	Ferrous sulfate	FeSO ₄	Acros Organics	ACS grade
2	Ferric chloride	FeCl ₃	Acros Organics	ACS grade
3	CleanER-10	CleanER	Höganäs Environment Solutions ²	Injectable zero-valent iron; D50: 7–8 µm
4	FerroBlack-Fe+	FB-Fe+	Redox Solutions	Injectable iron sulfide
5	Potassium permanganate ¹	KMnO ₄	Fisher Chemical	ACS grade
6	Ferrous sulfate and potassium permanganate ¹	FeSO ₄ + KMnO ₄	Acros Organics (FeSO ₄) and Fisher Chemical (KMnO ₄)	≥99% for analysis (FeSO ₄); ACS grade (KMnO ₄)
7	Ferric chloride with potassium permanganate and manganese chloride ¹	FeCl ₃ + KMnO ₄ + MnCl ₂	Acros Organics (FeCl ₃), Fisher Chemical (KMnO ₄), and ChemProducts (MnCl ₂)	99% for Analysis (FeCl ₃); ACS grade (KMnO ₄); ACS Grade (MnCl ₂)
8	Barium chloride	BaCl ₂	Sigma Aldrich	99.9% trace metals basis
9	Barium chloride and sodium sulphate anhydrous	BaCl ₂ + NaSO ₄	Sigma Aldrich ('BaCl ₂) and Fisher Chemical (NaSO ₄)	99.9% trace metals basis
10	Aeration	Aeration	--	Passive aeration
11	Potassium permanganate dose 1 with sodium bicarbonate	KMnO ₄ Dose 1 + Buffer 1	Fisher Chemical (KMnO ₄) and ChemProducts (NaHCO ₃)	Dose 1 is ACS grade KMnO ₄ ; Buffer 1 is sodium bicarbonate (NaHCO ₃).
12	Potassium permanganate dose 2 with sodium bicarbonate	KMnO ₄ Dose 2 + Buffer 1	Fisher Chemical (KMnO ₄) and ChemProducts (NaHCO ₃)	Dose 2 is ACS grade KMnO ₄ ; Buffer 1 is sodium bicarbonate (NaHCO ₃).
13	Potassium permanganate dose 2 with sodium bicarbonate/sodium carbonate mixture	KMnO ₄ Dose 2 + Buffer 2	Fisher Chemical (KMnO ₄), ChemProducts (NaHCO ₃), and Fisher Chemical (Na ₂ CO ₃)	Dose 2 is ACS grade KMnO ₄ ; Buffer 2 is sodium bicarbonate/sodium carbonate mixture (NaHCO ₃ /Na ₂ CO ₃).
14	Potassium permanganate dose 3 with sodium bicarbonate	KMnO ₄ Dose 3 + Buffer 1	Fisher Chemical (KMnO ₄) and ChemProducts (NaHCO ₃)	Dose 3 is ACS grade KMnO ₄ ; Buffer 1 is sodium bicarbonate (NaHCO ₃).
15	Ferrous sulfate with sodium bicarbonate	FeSO ₄ + Buffer 1	Acros Organics (FeSO ₄) and ChemProducts (NaHCO ₃)	ACS grade (FeSO ₄); Buffer 1 is sodium bicarbonate (NaHCO ₃).
16	Ferrous sulfate with sodium bicarbonate/sodium carbonate mixture	FeSO ₄ + Buffer 2	Acros Organics (FeSO ₄), ChemProducts (NaHCO ₃), and Fisher Chemical (Na ₂ CO ₃)	ACS grade (FeSO ₄); Buffer 2 is sodium bicarbonate/sodium carbonate mixture (NaHCO ₃ /Na ₂ CO ₃).
17	Aeration with sodium bicarbonate	Aeration + Buffer 1	ChemProducts (NaHCO ₃)	Passive aeration; Buffer 1 is sodium bicarbonate (NaHCO ₃).

Notes:

1. Indicates this reagent was tested at neutral pH and at pH 9.5 (adjusted by sodium hydroxide) for BY-AP-MW-15V only.

2. Indicates reagent may no longer be commercially available by the vendor.

--: not applicable

µm: micrometer

ACS: American Chemical Society

D50: median diameter

Table 2
Initial Groundwater Characterization Results

Notes:

Samples were field filtered with a 0.45-micron filter at the time of collection and filtered again prior to analysis for dissolved constituents.

Samples collected on May 24, 2022; November 2, 2022; and April 3, 2023, were sent directly to the analytical laboratories from the field.

Samples collected in May 2022 were used in the initial screening batch test.

Samples collected in November 2022 were used in the optimization batch test.

Samples collected in April 2023 were used in the column test.

Groundwater from BY-AP-MW-15V was used in the initial screening and optimization batch tests.

Groundwater from BY-AP-MW-15 was used in the column tests.

Background groundwater from BY-AP-MW-2 was used in the column desorption test.

--: not measured

µg/L: microgram per liter

µS/cm: microsiemen per centimeter

J: indicates the result is an estimated value

mg/L: milligram per liter

mV: millivolt

NTU: nephelometric turbidity unit

ORP: oxidation reduction potential

pCi/L: picocurie per liter

SU: standard unit

U: indicates the compound was analyzed for but not detected (Value was set to practical quantitation limit.)

Notes:
 Reaction time was 7 days.
 1. Arsenic was spiked to a target of 500 ug/L in each groundwater sample under anaerobic conditions.
 --: not applicable
 µg/L: microgram per liter
 µS/cm: microsiemen per centimeter
 BaCl₂: barium chloride
 CleanER: CleanER-10
 Control: no reagent added
 Dup: duplicate
 FeCl₃: ferric chloride
 FeCl₃ + KMnO₄ + MnCl₂: ferric chloride with potassium permanganate and manganese chloride
 FeSO₄: ferrous sulfate
 FeSO₄ + KMnO₄: ferrous sulfate with potassium permanganate
 GWPS: groundwater protection standard
 J: indicates the result is an estimated value
 KMnO₄: potassium permanganate
 mV: millivolt
 ORP: oxidation reduction potential
 SC: specific conductivity
 U: indicates the value was analyzed for but not detected (Value is set to method detection limit.)

Notes:

1. Arsenic was spiked to a target of 500 µg/L in each groundwater sample under anaerobic conditions. A subsample was collected immediately after spiking for dissolved arsenic concentrations.

Reaction time was 7 days.

--: not applicable

µg/L: microgram per liter

µS/cm: microsiemen per centimeter

Buffer 1: sodium bicarbonate

Buffer 2: sodium bicarbonate and sodium carbonate

Control: no reagent added

Dup: duplicate

GWPS: groundwater protection standard

J: indicates the result is an estimated value

mV: millivolt

ORP: oxidation-reduction potential

SC: specific conductivity

U: indicates the compound was analyzed for but not detected (Value is set to method detection limit.)

Table 13
Summary of Performance of Tested Reagents in Batch Testing

Reagent	BY-AP-MW-1	BY-AP-MW-8	BY-AP-MW-10	BY-AP-MW-15V		BY-AP-MW-24H
	As	As	As	As	Co	As
FeSO ₄						
FeCl ₃						
CleanER						
KMnO ₄						
KMnO ₄ at pH 9.5	N/T	N/T	N/T			N/T
FeSO ₄ + KMnO ₄						
FeSO ₄ + KMnO ₄ at pH 9.5	N/T	N/T	N/T			N/T
FeCl ₃ + KMnO ₄ + MnCl ₂						
FeCl ₃ + KMnO ₄ + MnCl ₂ at pH 9.5	N/T	N/T	N/T			N/T
BaCl ₂ + NaSO ₄						
BaCl ₂						
Aeration + Buffer						
FerroBlack						
KMnO ₄ (Dose 1) + Buffer 1	N/T	N/T	N/T			N/T
KMnO ₄ (Dose 2) + Buffer 1						
KMnO ₄ (Dose 2) + Buffer 2						
KMnO ₄ (Dose 3) + Buffer 1	N/T	N/T	N/T			N/T
FeSO ₄ + Buffer 1						
FeSO ₄ + Buffer 2						
Aeration + Buffer 1						

Notes:

Green cells indicate the concentration was decreased to less than the GWPS.

Yellow cells indicate the concentration was decreased by >50%, but the GWPS was not reached.

Orange cells indicate the concentration was decreased by <50%, and the GWPS was not reached.

As: arsenic

BaCl₂: barium chloride

BaCl₂ + NaSO₄: barium chloride with sodium sulfate

Buffer 1: sodium bicarbonate

Buffer 2: sodium bicarbonate and sodium carbonate

CleanER: CleanER-10

Co: cobalt

FeCl₃: ferric chloride

FeCl₃ + KMnO₄ + MnCl₂: ferric chloride with potassium permanganate and manganese chloride

FeSO₄: ferrous sulfate

FeSO₄ + KMnO₄: ferrous sulfate with potassium permanganate

GWPS: groundwater protection standard

KMnO₄: potassium permanganate

N/T: not tested

Table 14
Column Test Setup

Column No.	Reagent	Groundwater ID	Aquifer Soil ID (depth; feet)	COI
1	KMnO ₄ + NaHCO ₃	BY-AP-MW-1	BY-AP-PT-3 (33.0–40.0)	As
2	KMnO ₄ + NaHCO ₃	BY-AP-MW-8	BY-AP-PT-5 (50.0–70.0)	As
3	KMnO ₄ + NaHCO ₃	BY-AP-MW-10	BY-AP-PT-1 (55.0–68.0)	As
4	KMnO ₄ + NaHCO ₃	BY-AP-MW-15	BY-AP-PT-2 (75.0–80.0)	As and Co
5	FeSO ₄ + Na ₂ CO ₃ /NaHCO ₃	BY-AP-MW-15	BY-AP-PT-2 (75.0–80.0)	As and Co
6	KMnO ₄ + NaHCO ₃	BY-AP-MW-24H	BY-AP-PT-2 (65.0–70.0)	As

Notes:

--: not applicable

As: arsenic

Co: cobalt

COI: constituent of interest

KMnO₄ + NaHCO₃: potassium permanganate with sodium bicarbonate

FeSO₄ + Na₂CO₃/NaHCO₃: ferrous sulfate with sodium bicarbonate and sodium carbonate

Table 15
Column Test Operating Conditions

Parameter	Value	Unit
Column media depth	22.0	cm
Column inner diameter	4.2	cm
Flow rate ¹	0.65	mL/min
Porosity	33	%
Hydraulic residence time ¹	2.6	hours
Superficial velocity ¹	67.1	cm/day
Test duration	7 (+3 leaching test)	days
Pore volumes treated	60–70	--

Notes:

1. Values are based on the average measured flow rates of all columns during the duration of the column experiment.

--: not applicable

cm: centimeter

cm/day: centimeter per day

mL/min: milliliter per minute

Notes:

1. Flow rate was measured in effluent samples only.

--: not applicable

µg/L: microgram per liter

µS/cm: microsiemen per centimeter

DNM: did not measure

J: indicates the result is an estimated value

mL/min: milliliter per minute

mV: millivolt

ORP: oxidation reduction potential

SC: specific conductivity

U: indicates the compound was analyzed for but not detected (Value is set to instrument detection limit.)

Notes:

All results are reported on a dry weight basis.

DNM: did not measure

Dup: duplicate

F1: Water soluble, weakly sorbed (extracted by 1 M magnesium chloride to pH 7)

F2: Exchangeable, strongly sorbed, e.g., on clay minerals (extracted by 1 M monosodium phosphate at pH 5)

F3: Reducible, e.g., poorly crystalline metal oxides such as iron and manganese oxides (extracted by 0.1 M hydroxylamine/hydrogen chloride adjusted to pH 2 with nitric acid)

F4: Oxidizable, e.g., crystalline oxide and crystalline sulfide minerals (extracted by 16 M nitric acid)

F5: Residual, e.g., relict silicate phases from the aquifer matrix (prepared by U.S. Environmental Protection Agency Method 3050B)

FeSO₄ + NaHCO₃ + Na₂CO₃: ferrous sulfate with sodium bicarbonate and sodium carbonate

J: indicates the result is an estimated value

KMnO₄ + NaHCO₃: potassium permanganate with sodium bicarbonate

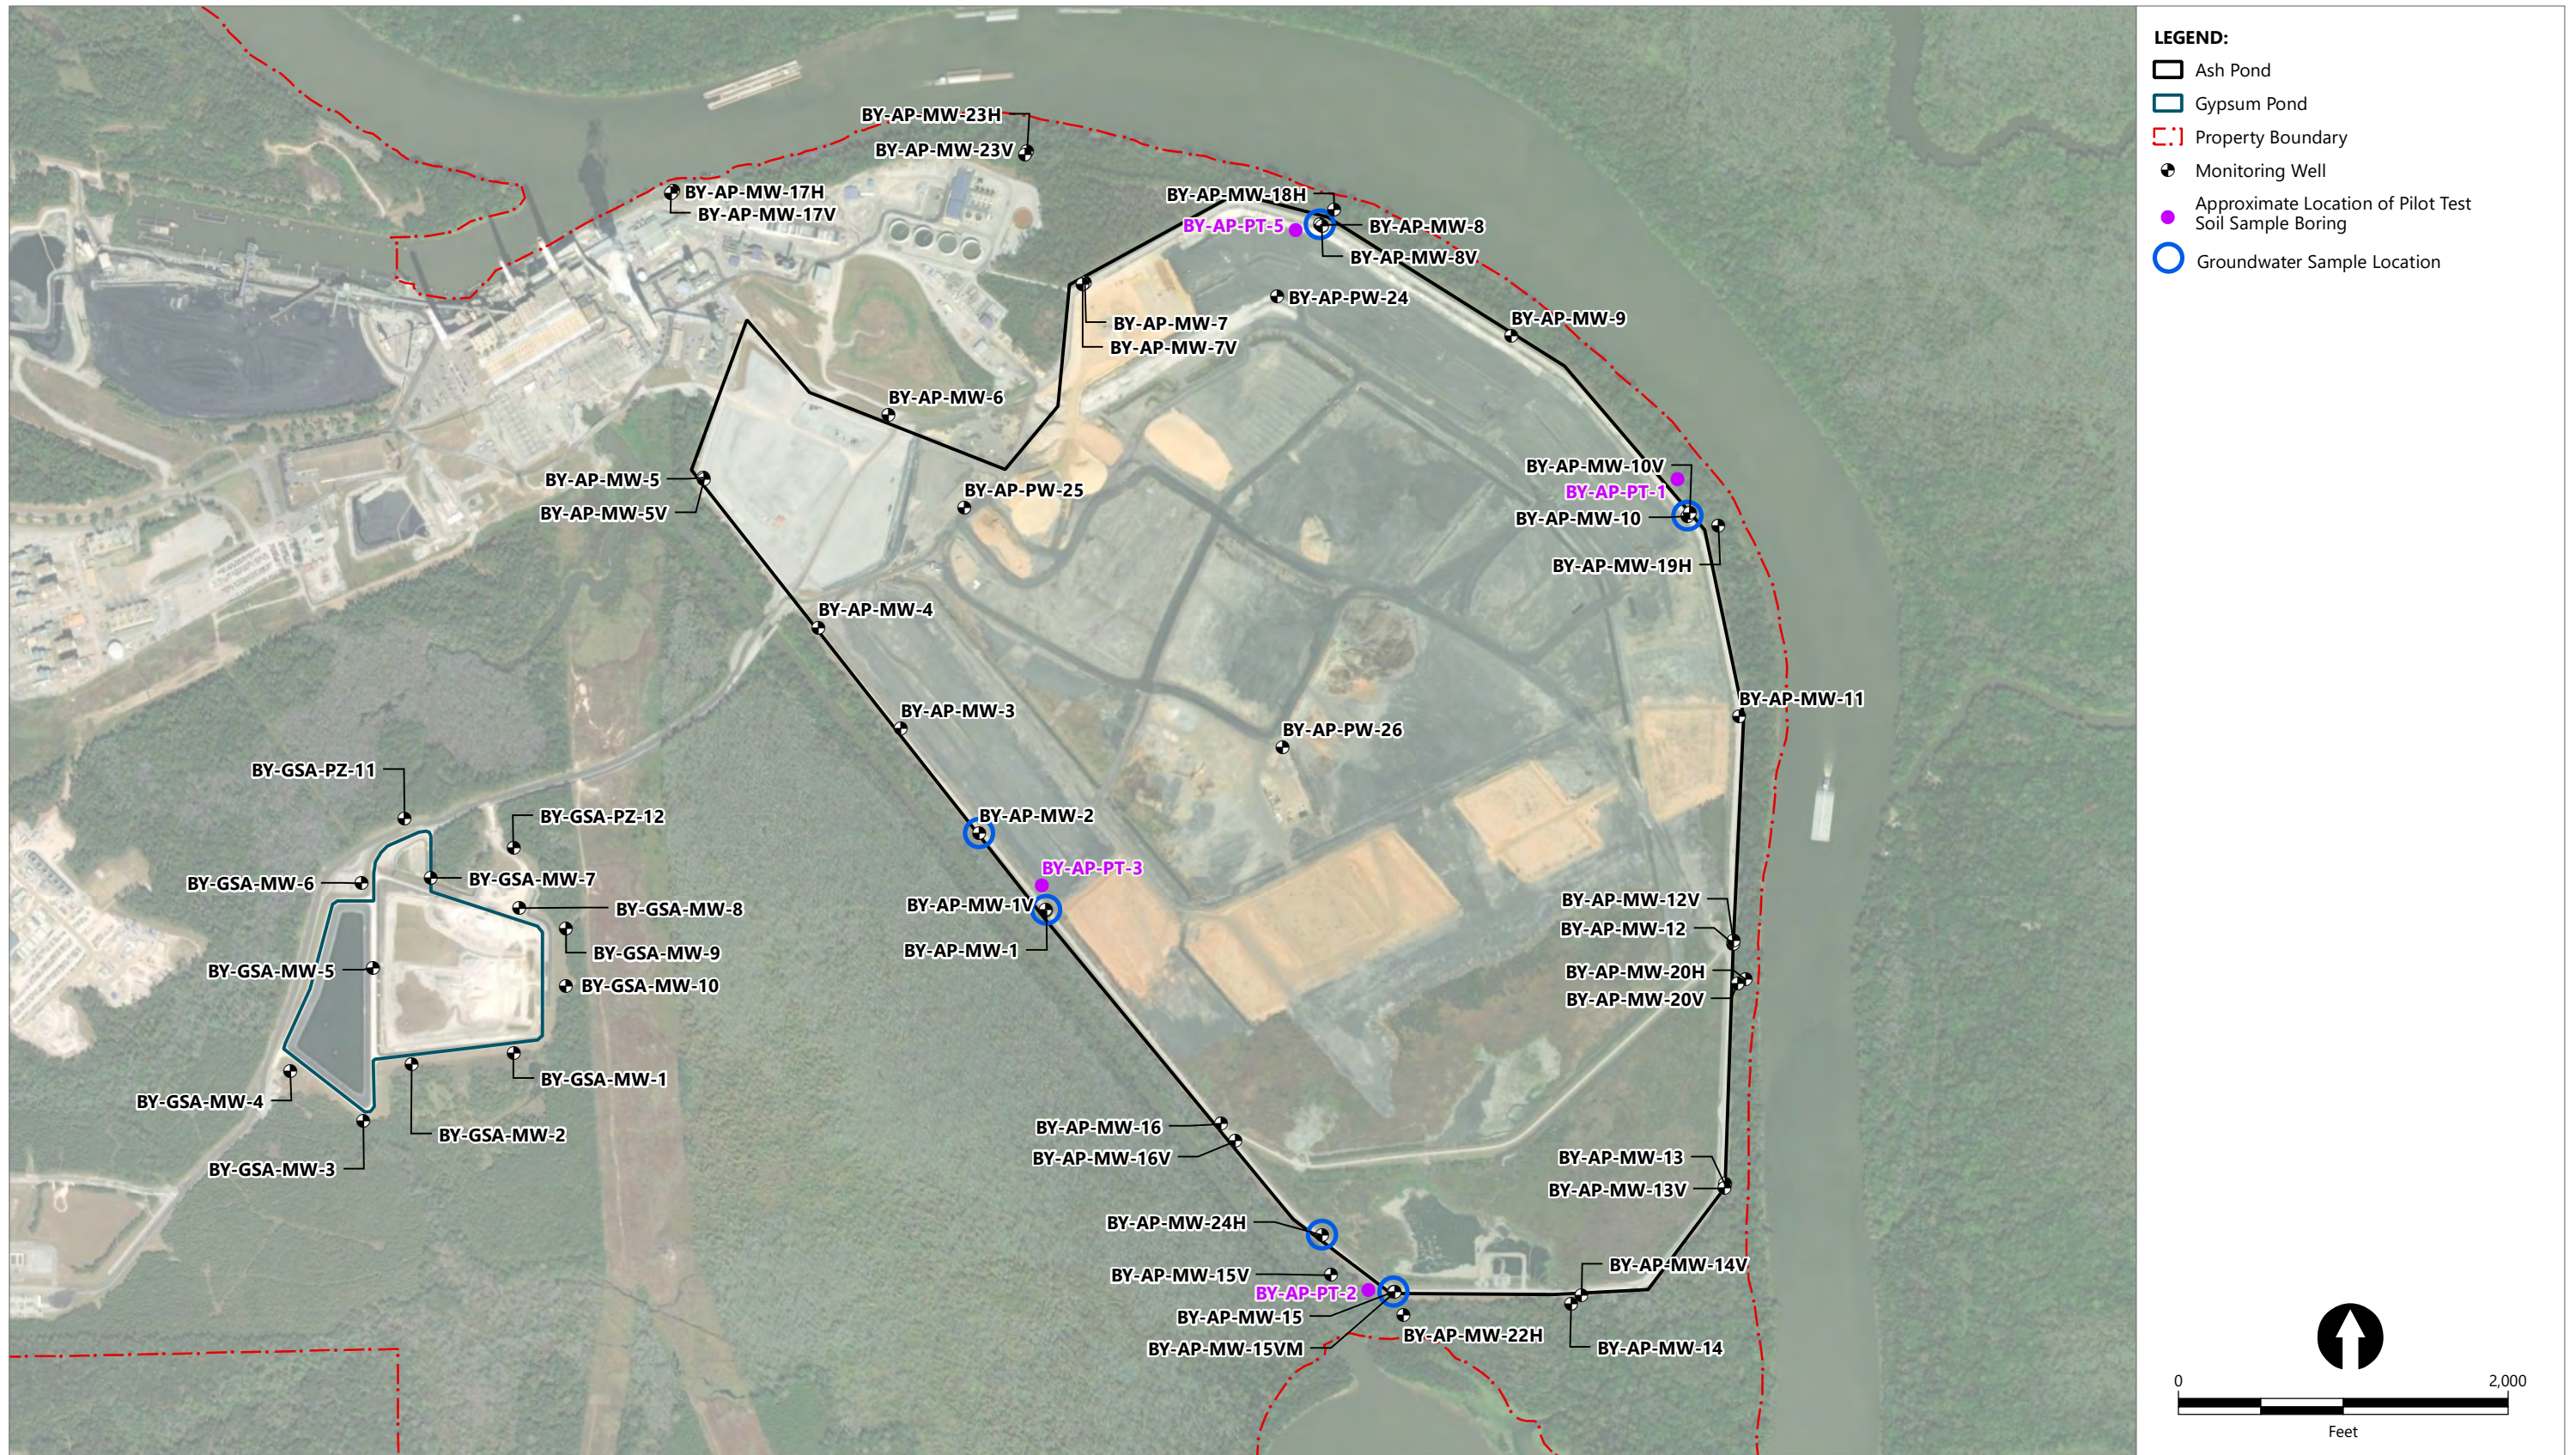

M: molar

mg/kg: milligram per kilogram

SSE: selective sequential extraction

U: indicates the compound was analyzed for but not detected (Value is set to instrument detection limit.)

Figure 20
Column Breakthrough Curve for BY-AP-MW-24H
 Laboratory Treatability Study Results
 Plant Barry

Notes:

Influent arsenic concentration in the BY-AP-MW-1, BY-AP-MW-10, BY-AP-MW-15, and BY-AP-MW-24H columns ranged from slightly above to lower than the groundwater protection standard. Effluent solutions from these columns all contained arsenic concentrations lower than the corresponding influent solutions. Arsenic uptake capacity could not be estimated for these wells due to arsenic removal in the influent reservoirs.

mg/kg: milligram per kilogram

Laboratory Results for: Barry

Dear Masa,

Enclosed are the results of the sample(s) submitted to our laboratory May 27, 2022
For your reference, these analyses have been assigned our service request number **K2205825**.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3376. You may also contact me via email at Mark.Harris@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Client: Anchor QEA, LLC
Project: Barry
Sample Matrix: Water

Service Request: K2205825
Date Received: 05/27/2022

CASE NARRATIVE

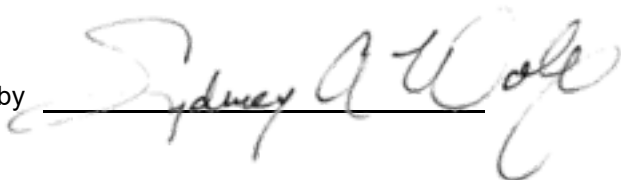

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier II level requested by the client.

Sample Receipt:

Seven water samples were received for analysis at ALS Environmental on 05/27/2022. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

Metals:

No significant anomalies were noted with this analysis.

Approved by  Date 06/03/2022

SAMPLE DETECTION SUMMARY

This form includes only detections above the reporting levels. For a full listing of sample results, continue to the Sample Results section of this Report.

Cooler Receipt and Preservation Form

Client Anchovy Service Request K22 05825
Received: 5/27/22 Opened: 5/27/22 By: [Signature] Unloaded: 5/27/22 By: [Signature]

- 1. Samples were received via? USPS Fed Ex UPS DHL PDX Courier Hand Delivered
- 2. Samples were received in: (circle) Cooler Box Envelope Other NA
- 3. Were custody seals on coolers? NA Y N If yes, how many and where? _____
If present, were custody seals intact? Y N If present, were they signed and dated? Y N

Temp Blank	Sample Temp	IR Gun	Cooler #/COC ID / NA	Out of temp indicate with "X"	PM Notified If out of temp	Tracking Number NA	Filed
<u>3.9</u>		<u>IR02</u>					

- 4. Was a Temperature Blank present in cooler? NA Y N If yes, notate the temperature in the appropriate column above:
If no, take the temperature of a representative sample bottle contained within the cooler; notate in the column "Sample Temp":
- 5. Were samples received within the method specified temperature ranges? NA Y N
If no, were they received on ice and same day as collected? If not, notate the cooler # below and notify the PM. NA Y N
- If applicable, tissue samples were received: Frozen Partially Thawed Thawed
- 6. Packing material: Inserts Baggies Bubble Wrap Gel Packs Wet Ice Dry Ice Sleeves _____
- 7. Were custody papers properly filled out (ink, signed, etc.)? NA Y N
- 8. Were samples received in good condition (unbroken) NA Y N
- 9. Were all sample labels complete (ie, analysis, preservation, etc.)? NA Y N
- 10. Did all sample labels and tags agree with custody papers? NA Y N
- 11. Were appropriate bottles/containers and volumes received for the tests indicated? NA Y N
- 12. Were the pH-preserved bottles (see SMO GEN SOP) received at the appropriate pH? Indicate in the table below NA Y N
- 13. Were VOA vials received without headspace? Indicate in the table below. NA Y N
- 14. Was C12/Res negative? NA Y N
- 15. Were 100ml sterile microbiology bottles filled exactly to the 100ml mark? NA Y N Under filled Overfilled

Sample ID on Bottle	Sample ID on COC	Identified by:

Sample ID	Bottle Count	Head-space	Broke	pH	Reagent	Volume added	Reagent Lot Number	Initials	Time

Notes, Discrepancies, Resolutions: _____

Inorganic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated value.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.
- H The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

- # The control limit criteria is not applicable.
- J The result is an estimated value.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
 - i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.
- Q See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated value.
- J The result is an estimated value.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
 - i The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.

Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/analyte is offered by that state.

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit

Laboratory Results for: Barry

Dear Masa,

Enclosed are the results of the sample(s) submitted to our laboratory November 07, 2022
For your reference, these analyses have been assigned our service request number **K2213120**.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3376. You may also contact me via email at Mark.Harris@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Mark Harris

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier II level requested by the client.

Sample Receipt:

Eight water samples were received for analysis at ALS Environmental on 11/07/2022. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

Metals:

No significant anomalies were noted with this analysis.

Approved by _____

Date 11/18/2022

SAMPLE DETECTION SUMMARY

This form includes only detections above the reporting levels. For a full listing of sample results, continue to the Sample Results section of this Report.

 Received: 11/7/22 Opened: 11/7/22 By: VM Unloaded: 11/7/22 By: VM

1. Samples were received via? USPS Fed Ex UPS DHL PDX Courier Hand Delivered
 2. Samples were received in: (circle) Cooler Box Envelope Other NA
 3. Were custody seals on coolers? NA Y N If yes, how many and where? _____
 If present, were custody seals intact? Y N If present, were they signed and dated? Y N

Temp Blank	Sample Temp	IR Gun	Cooler #/COC ID / NA	Out of temp indicate with "X"	PM Notified If out of temp	Tracking Number NA	Filed
<u>5.4</u>		<u>IR01</u>					

4. Was a Temperature Blank present in cooler? NA Y N If yes, notate the temperature in the appropriate column above:
 If no, take the temperature of a representative sample bottle contained within the cooler; notate in the column "Sample Temp":
 5. Were samples received within the method specified temperature ranges? NA Y N
 If no, were they received on ice and same day as collected? If not, notate the cooler # below and notify the PM. NA Y N

If applicable, tissue samples were received: Frozen Partially Thawed Thawed

6. Packing material: Inserts Baggies Bubble Wrap Gel Packs Wet Ice Dry Ice Sleeves _____
 7. Were custody papers properly filled out (ink, signed, etc.)? NA Y N
 8. Were samples received in good condition (unbroken) NA Y N
 9. Were all sample labels complete (ie, analysis, preservation, etc.)? NA Y N
 10. Did all sample labels and tags agree with custody papers? NA Y N
 11. Were appropriate bottles/containers and volumes received for the tests indicated? NA Y N
 12. Were the pH-preserved bottles (see SMO GEN SOP) received at the appropriate pH? Indicate in the table below NA Y N
 13. Were VOA vials received without headspace? Indicate in the table below. NA Y N
 14. Was C12/Res negative? NA Y N
 15. Were 100ml sterile microbiology bottles filled exactly to the 100ml mark? NA Y N Under filled Overfilled

Inorganic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated value.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.
- H The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

- # The control limit criteria is not applicable.
- J The result is an estimated value.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
 - i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.
- Q See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated value.
- J The result is an estimated value.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
 - i The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.

Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/analyte is offered by that state.

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit

Laboratory Results for: Barry 2023-2024

Dear Masa,

Enclosed are the results of the sample(s) submitted to our laboratory April 07, 2023
For your reference, these analyses have been assigned our service request number **K2304153**.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3376. You may also contact me via email at Mark.Harris@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier II level requested by the client.

Sample Receipt:

Eight water samples were received for analysis at ALS Environmental on 04/07/2023. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

Metals:

No significant anomalies were noted with this analysis.

Noel D. O'Connell

Cooler Receipt and Preservation Form

Client Anchor QEA Service Request K23 04153
Received: 4-7-23 Opened: 4-7-23 By: JM Unloaded: 4-7-23 By: JM

- 1. Samples were received via? USPS Fed Ex UPS DHL PDX Courier Hand Delivered
- 2. Samples were received in: (circle) Cooler Box Envelope Other NA
- 3. Were custody seals on coolers? NA Y N If yes, how many and where? _____
If present, were custody seals intact? Y N If present, were they signed and dated? Y N

Temp Blank	Sample Temp	IR Gun	Cooler #/COC ID / NA	Out of temp Indicate with "X"	PM Notified If out of temp	Tracking Number NA	Filed
1.9		J201					

- 4. Was a Temperature Blank present in cooler? NA Y N If yes, notate the temperature in the appropriate column above:
If no, take the temperature of a representative sample bottle contained within the cooler; notate in the column "Sample Temp":
- 5. Were samples received within the method specified temperature ranges? NA Y N
If no, were they received on ice and same day as collected? If not, notate the cooler # above and notify the PM. NA Y N

If applicable, tissue samples were received: Frozen Partially Thawed Thawed

- 6. Packing material: Inserts Baggies Bubble Wrap Gel Packs Wet Ice Dry Ice Sleeves _____
- 7. Were custody papers properly filled out (ink, signed, etc.)? NA Y N
- 8. Were samples received in good condition (unbroken) NA Y N
- 9. Were all sample labels complete (ie, analysis, preservation, etc.)? NA Y N
- 10. Did all sample labels and tags agree with custody papers? NA Y N
- 11. Were appropriate bottles/containers and volumes received for the tests indicated? NA Y N
- 12. Were the pH-preserved bottles (see SMO GEN SOP) received at the appropriate pH? Indicate in the table below NA Y N
- 13. Were VOA vials received without headspace? Indicate in the table below. NA Y N
- 14. Was C12/Res negative? NA Y N
- 15. Were samples received within the method specified time limit? If not, notate the error below and notify the PM NA Y N
- 16. Were 100ml sterile microbiology bottles filled exactly to the 100ml mark? NA Y N Underfilled Overfilled

Sample ID on Bottle	Sample ID on COC	Identified by:

Sample ID	Bottle Count	Bottle Type	Head-space	Broke	pH	Reagent	Volume added	Reagent Lot Number	Initials	Time

Inorganic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated value.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.
- H The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

- # The control limit criteria is not applicable.
- J The result is an estimated value.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
 - i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.
- Q See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated value.
- J The result is an estimated value.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
 - i The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.

Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/analyte is offered by that state.

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Matrix Spike and Matrix Spike Duplicate Data is presented for information purposes only. The matrix may or may not be relevant to samples reported in this report. The laboratory evaluates system performance based on the LCS and LCSD control limits.

RE: A2D0996 - Barry 2022 - 201114-01.02

Thank you for using Apex Laboratories. We greatly appreciate your business and strive to provide the highest quality services to the environmental industry.

Enclosed are the results of analyses for work order A2D0996, which was received by the laboratory on 4/25/2022 at 12:44:00PM.

If you have any questions concerning this report or the services we offer, please feel free to contact me by email at: dthomas@apex-labs.com, or by phone at 503-718-2323.

Please note: All samples will be disposed of within 30 days of sample receipt, unless prior arrangements have been made.

Cooler Receipt Information

QUALIFIER DEFINITIONS

Client Sample and Quality Control (QC) Sample Qualifier Definitions:

Apex Laboratories

- B-02** Analyte detected in an associated blank at a level between one-half the MRL and the MRL. (See Notes and Conventions below.)
- GS-01** See detailed Particle Size Analysis results, accumulation curves, and Case Narratives at the end of this report.
- H-01** This sample was analyzed outside the recommended holding time.
- H-08** Sample hold time extended by freezing at -18 degrees C. Total time at 4 degrees C was less than the method hold time.
- J** Estimated Result. Result detected below the lowest point of the calibration curve, but above the specified MDL.
- Q-04** Spike recovery and/or RPD is outside control limits due to a non-homogeneous sample matrix.
- Q-05** Analyses are not controlled on RPD values from sample and duplicate concentrations that are below 5 times the reporting level.

Analytical Resources, LLC

- D** The reported value is from a dilution
- U** This analyte is not detected above the reporting limit (RL) or if noted, not detected above the limit of detection (LOD).

Anchor QEA, LLC 6720 SW Macadam Ave. Suite 125 Portland, OR 97219	Project: Barry 2022 Project Number: 201114-01.02 Project Manager: Jessica Goin, PhD	Report ID: A2D0996 - 05 19 22 1407
--	--	---

REPORTING NOTES AND CONVENTIONS:

Abbreviations:

- DET Analyte DETECTED at or above the detection or reporting limit.
- ND Analyte NOT DETECTED at or above the detection or reporting limit.
- NR Result Not Reported
- RPD Relative Percent Difference. RPDs for Matrix Spikes and Matrix Spike Duplicates are based on concentration, not recovery.

Detection Limits: Limit of Detection (LOD)

Limits of Detection (LODs) are normally set at a level of one half the validated Limit of Quantitation (LOQ).
If no value is listed ('-----'), then the data has not been evaluated below the Reporting Limit.

Reporting Limits: Limit of Quantitation (LOQ)

Validated Limits of Quantitation (LOQs) are reported as the Reporting Limits for all analyses where the LOQ, MRL, PQL or CRL are requested. The LOQ represents a level at or above the low point of the calibration curve, that has been validated according to Apex Laboratories' comprehensive LOQ policies and procedures.

Reporting Conventions:

- Basis: Results for soil samples are generally reported on a 100% dry weight basis.
The Result Basis is listed following the units as " dry", " wet", or " " (blank) designation.
- " dry" Sample results and Reporting Limits are reported on a dry weight basis. (i.e. "ug/kg dry")
See Percent Solids section for details of dry weight analysis.
- " wet" Sample results and Reporting Limits for this analysis are normally dry weight corrected, but have not been modified in this case.
- " " Results without 'wet' or 'dry' designation are not normally dry weight corrected. These results are considered 'As Received'.

QC Source:

In cases where there is insufficient sample provided for Sample Duplicates and/or Matrix Spikes, a Lab Control Sample Duplicate (LCS Dup) may be analyzed to demonstrate accuracy and precision of the extraction batch.

Non-Client Batch QC Samples (Duplicates and Matrix Spike/Duplicates) may not be included in this report. Please request a Full QC report if this data is required.

Miscellaneous Notes:

- " --- " QC results are not applicable. For example, % Recoveries for Blanks and Duplicates, % RPD for Blanks, Blank Spikes and Matrix Spikes, etc.
- " *** " Used to indicate a possible discrepancy with the Sample and Sample Duplicate results when the %RPD is not available. In this case, either the Sample or the Sample Duplicate has a reportable result for this analyte, while the other is Non Detect (ND).

Blanks:

Standard practice is to evaluate the results from Blank QC Samples down to a level equal to ½ the Reporting Limit (RL).
-For Blank hits falling between ½ the RL and the RL (J flagged hits), the associated sample and QC data will receive a 'B-02' qualifier.
-For Blank hits above the RL, the associated sample and QC data will receive a 'B' qualifier, per Apex Laboratories' Blank Policy.
For further details, please request a copy of this document.

DRAFT REPORT

The results provided in this report are PRELIMINARY and are subject to change based on subsequent analysis, QC validation or final data review. Please use these results with the understanding that they may have not been finalized by the laboratory.

ANALYTICAL REPORT

Apex Laboratories, LLC

6700 S.W. Sandburg Street
Tigard, OR 97223
503-718-2323
ORELAP ID: OR100062

Table with 3 columns: Client (Anchor QEA, LLC), Project (Barry 2022), and Report ID (A2D0996 - 05 19 22 1407)

REPORTING NOTES AND CONVENTIONS (Cont.):

Blanks (Cont.):

Sample results flagged with a 'B' or 'B-02' qualifier are potentially biased high if the sample results are less than ten times the level found in the blank for inorganic analyses, or less than five times the level found in the blank for organic analyses.

'B' and 'B-02' qualifications are only applied to sample results detected above the Reporting Level.

Preparation Notes:

Mixed Matrix Samples:

Water Samples:

Water samples containing significant amounts of sediment are decanted or separated prior to extraction, and only the water portion analyzed, unless otherwise directed by the client.

Soil and Sediment Samples:

Soil and Sediment samples containing significant amounts of water are decanted prior to extraction, and only the solid portion analyzed, unless otherwise directed by the client.

Sampling and Preservation Notes:

Certain regulatory programs, such as National Pollutant Discharge Elimination System (NPDES), require that activities such as sample filtration (for dissolved metals, orthophosphate, hexavalent chromium, etc.) and testing of short hold analytes (pH, Dissolved Oxygen, etc.) be performed in the field (on-site) within a short time window.

Data users should be aware of which regulations pertain to the samples they submit for testing. If related sample collection activities are not approved for a particular regulatory program, results should be considered estimates.

Samples that have been filtered and preserved at Apex Laboratories per client request are listed in the preparation section of the report with the date and time of filtration listed.

Apex Laboratories maintains detailed records on sample receipt, including client label verification, cooler temperature, sample preservation, hold time compliance and field filtration. Data is qualified as necessary, and the lack of qualification indicates compliance with required parameters.

LABORATORY ACCREDITATION INFORMATION

ORELAP Certification ID: OR100062 (Primary Accreditation) -
EPA ID: OR01039

All methods and analytes reported from work performed at Apex Laboratories are included on Apex Laboratories' ORELAP Scope of Certification, with the exception of any analyte(s) listed below:

Apex Laboratories

Table header with columns: Matrix, Analysis, TNI_ID, Analyte, TNI_ID, Accreditation

All reported analytes are included in Apex Laboratories' current ORELAP scope.

Secondary Accreditations

Apex Laboratories also maintains reciprocal accreditation with non-TNI states (Washington DOE), as well as other state specific accreditations not listed here.

Subcontract Laboratory Accreditations

Subcontracted data falls outside of Apex Laboratories' Scope of Accreditation. Please see the Subcontract Laboratory report for full details, or contact your Project Manager for more information.

Field Testing Parameters

Results for Field Tested data are provided by the client or sampler, and fall outside of Apex Laboratories' Scope of Accreditation.

RE: A2E0189 - Barry 2022 - 201114-01.02 Task 09

Thank you for using Apex Laboratories. We greatly appreciate your business and strive to provide the highest quality services to the environmental industry.

Enclosed are the results of analyses for work order A2E0189, which was received by the laboratory on 5/5/2022 at 2:02:00PM.

If you have any questions concerning this report or the services we offer, please feel free to contact me by email at: dthomas@apex-labs.com, or by phone at 503-718-2323.

Please note: All samples will be disposed of within 30 days of sample receipt, unless prior arrangements have been made.

QUALIFIER DEFINITIONS

Client Sample and Quality Control (QC) Sample Qualifier Definitions:

Apex Laboratories

- A-01** pH >2 after additional acid preservation.
- A-01a** pH of 7. No change after preservation.
- A-02** pH > 2. No change after preservation.
- J** Estimated Result. Result detected below the lowest point of the calibration curve, but above the specified MDL.
- Q-01** Spike recovery and/or RPD is outside acceptance limits.
- Q-02** Spike recovery is outside of established control limits due to matrix interference.
- Q-16** Reanalysis of an original Batch QC sample.
- Q-42** Matrix Spike and/or Duplicate analysis was performed on this sample. % Recovery or RPD for this analyte is outside laboratory control limits. (Refer to the QC Section of Analytical Report.)

DRAFT REPORT

The results provided in this report are PRELIMINARY and are subject to change based on subsequent analysis, QC validation or final data review. Please use these results with the understanding that they may have not been finalized by the laboratory.

ANALYTICAL REPORT

Apex Laboratories, LLC

6700 S.W. Sandburg Street
Tigard, OR 97223
503-718-2323
ORELAP ID: OR100062

Anchor QEA, LLC 6720 SW Macadam Ave. Suite 125 Portland, OR 97219	Project: Barry 2022 Project Number: 201114-01.02 Task 09 Project Manager: Masakazu Kanematsu	Report ID: A2E0189 - 05 25 22 0356
--	---	---

REPORTING NOTES AND CONVENTIONS:

Abbreviations:

- DET Analyte DETECTED at or above the detection or reporting limit.
- ND Analyte NOT DETECTED at or above the detection or reporting limit.
- NR Result Not Reported
- RPD Relative Percent Difference. RPDs for Matrix Spikes and Matrix Spike Duplicates are based on concentration, not recovery.

Detection Limits: Limit of Detection (LOD)

Limits of Detection (LODs) are normally set at a level of one half the validated Limit of Quantitation (LOQ).
If no value is listed ('-----'), then the data has not been evaluated below the Reporting Limit.

Reporting Limits: Limit of Quantitation (LOQ)

Validated Limits of Quantitation (LOQs) are reported as the Reporting Limits for all analyses where the LOQ, MRL, PQL or CRL are requested. The LOQ represents a level at or above the low point of the calibration curve, that has been validated according to Apex Laboratories' comprehensive LOQ policies and procedures.

Reporting Conventions:

- Basis: Results for soil samples are generally reported on a 100% dry weight basis.
The Result Basis is listed following the units as " dry", " wet", or " " (blank) designation.
- " dry" Sample results and Reporting Limits are reported on a dry weight basis. (i.e. "ug/kg dry")
See Percent Solids section for details of dry weight analysis.
- " wet" Sample results and Reporting Limits for this analysis are normally dry weight corrected, but have not been modified in this case.
- " " Results without 'wet' or 'dry' designation are not normally dry weight corrected. These results are considered 'As Received'.

QC Source:

In cases where there is insufficient sample provided for Sample Duplicates and/or Matrix Spikes, a Lab Control Sample Duplicate (LCS Dup) may be analyzed to demonstrate accuracy and precision of the extraction batch.

Non-Client Batch QC Samples (Duplicates and Matrix Spike/Duplicates) may not be included in this report. Please request a Full QC report if this data is required.

Miscellaneous Notes:

- " --- " QC results are not applicable. For example, % Recoveries for Blanks and Duplicates, % RPD for Blanks, Blank Spikes and Matrix Spikes, etc.
- " *** " Used to indicate a possible discrepancy with the Sample and Sample Duplicate results when the %RPD is not available. In this case, either the Sample or the Sample Duplicate has a reportable result for this analyte, while the other is Non Detect (ND).

Blanks:

Standard practice is to evaluate the results from Blank QC Samples down to a level equal to ½ the Reporting Limit (RL).
-For Blank hits falling between ½ the RL and the RL (J flagged hits), the associated sample and QC data will receive a 'B-02' qualifier.
-For Blank hits above the RL, the associated sample and QC data will receive a 'B' qualifier, per Apex Laboratories' Blank Policy.
For further details, please request a copy of this document.

DRAFT REPORT

The results provided in this report are PRELIMINARY and are subject to change based on subsequent analysis, QC validation or final data review. Please use these results with the understanding that they may have not been finalized by the laboratory.

ANALYTICAL REPORT

Apex Laboratories, LLC

6700 S.W. Sandburg Street
Tigard, OR 97223
503-718-2323
ORELAP ID: OR100062

Anchor QEA, LLC 6720 SW Macadam Ave. Suite 125 Portland, OR 97219	Project: Barry 2022 Project Number: 201114-01.02 Task 09 Project Manager: Masakazu Kanematsu	Report ID: A2E0189 - 05 25 22 0356
--	---	---

REPORTING NOTES AND CONVENTIONS (Cont.):

Blanks (Cont.):

Sample results flagged with a 'B' or 'B-02' qualifier are potentially biased high if the sample results are less than ten times the level found in the blank for inorganic analyses, or less than five times the level found in the blank for organic analyses.

'B' and 'B-02' qualifications are only applied to sample results detected above the Reporting Level.

Preparation Notes:

Mixed Matrix Samples:

Water Samples:

Water samples containing significant amounts of sediment are decanted or separated prior to extraction, and only the water portion analyzed, unless otherwise directed by the client.

Soil and Sediment Samples:

Soil and Sediment samples containing significant amounts of water are decanted prior to extraction, and only the solid portion analyzed, unless otherwise directed by the client.

Sampling and Preservation Notes:

Certain regulatory programs, such as National Pollutant Discharge Elimination System (NPDES), require that activities such as sample filtration (for dissolved metals, orthophosphate, hexavalent chromium, etc.) and testing of short hold analytes (pH, Dissolved Oxygen, etc.) be performed in the field (on-site) within a short time window. In addition, sample matrix spikes are required for some analyses, and sufficient volume must be provided, and billable site specific QC requested, if this is required. All regulatory permits should be reviewed to ensure that these requirements are being met.

Data users should be aware of which regulations pertain to the samples they submit for testing. If related sample collection activities are not approved for a particular regulatory program, results should be considered estimates. Apex Laboratories will qualify these analytes according to the most stringent requirements, however results for samples that are for non-regulatory purposes may be acceptable.

Samples that have been filtered and preserved at Apex Laboratories per client request are listed in the preparation section of the report with the date and time of filtration listed.

Apex Laboratories maintains detailed records on sample receipt, including client label verification, cooler temperature, sample preservation, hold time compliance and field filtration. Data is qualified as necessary, and the lack of qualification indicates compliance with required parameters.

RE: A2E0493 - Barry 2022 - 201114-01.02 Task 09

Thank you for using Apex Laboratories. We greatly appreciate your business and strive to provide the highest quality services to the environmental industry.

Enclosed are the results of analyses for work order A2E0493, which was received by the laboratory on 5/11/2022 at 11:32:00AM.

If you have any questions concerning this report or the services we offer, please feel free to contact me by email at: dthomas@apex-labs.com, or by phone at 503-718-2323.

Please note: All samples will be disposed of within 30 days of sample receipt, unless prior arrangements have been made.

Anchor QEA, LLC 6720 SW Macadam Ave. Suite 125 Portland, OR 97219	Project: Barry 2022 Project Number: 201114-01.02 Task 09 Project Manager: Masakazu Kanematsu	Report ID: A2E0493 - 06 02 22 1444
--	---	---

REPORTING NOTES AND CONVENTIONS:

Abbreviations:

- DET Analyte DETECTED at or above the detection or reporting limit.
- ND Analyte NOT DETECTED at or above the detection or reporting limit.
- NR Result Not Reported
- RPD Relative Percent Difference. RPDs for Matrix Spikes and Matrix Spike Duplicates are based on concentration, not recovery.

Detection Limits: Limit of Detection (LOD)

Limits of Detection (LODs) are normally set at a level of one half the validated Limit of Quantitation (LOQ).
If no value is listed ('-----'), then the data has not been evaluated below the Reporting Limit.

Reporting Limits: Limit of Quantitation (LOQ)

Validated Limits of Quantitation (LOQs) are reported as the Reporting Limits for all analyses where the LOQ, MRL, PQL or CRL are requested. The LOQ represents a level at or above the low point of the calibration curve, that has been validated according to Apex Laboratories' comprehensive LOQ policies and procedures.

Reporting Conventions:

- Basis: Results for soil samples are generally reported on a 100% dry weight basis.
The Result Basis is listed following the units as " dry", " wet", or " " (blank) designation.
- " dry" Sample results and Reporting Limits are reported on a dry weight basis. (i.e. "ug/kg dry")
See Percent Solids section for details of dry weight analysis.
- " wet" Sample results and Reporting Limits for this analysis are normally dry weight corrected, but have not been modified in this case.
- " " Results without 'wet' or 'dry' designation are not normally dry weight corrected. These results are considered 'As Received'.

QC Source:

In cases where there is insufficient sample provided for Sample Duplicates and/or Matrix Spikes, a Lab Control Sample Duplicate (LCS Dup) may be analyzed to demonstrate accuracy and precision of the extraction batch.

Non-Client Batch QC Samples (Duplicates and Matrix Spike/Duplicates) may not be included in this report. Please request a Full QC report if this data is required.

Miscellaneous Notes:

- " --- " QC results are not applicable. For example, % Recoveries for Blanks and Duplicates, % RPD for Blanks, Blank Spikes and Matrix Spikes, etc.
- " *** " Used to indicate a possible discrepancy with the Sample and Sample Duplicate results when the %RPD is not available. In this case, either the Sample or the Sample Duplicate has a reportable result for this analyte, while the other is Non Detect (ND).

Blanks:

Standard practice is to evaluate the results from Blank QC Samples down to a level equal to 1/2 the Reporting Limit (RL).
-For Blank hits falling between 1/2 the RL and the RL (J flagged hits), the associated sample and QC data will receive a 'B-02' qualifier.
-For Blank hits above the RL, the associated sample and QC data will receive a 'B' qualifier, per Apex Laboratories' Blank Policy.
For further details, please request a copy of this document.

DRAFT REPORT

The results provided in this report are PRELIMINARY and are subject to change based on subsequent analysis, QC validation or final data review. Please use these results with the understanding that they may have not been finalized by the laboratory.

ANALYTICAL REPORT

Apex Laboratories, LLC

6700 S.W. Sandburg Street
Tigard, OR 97223
503-718-2323
ORELAP ID: OR100062

Anchor QEA, LLC 6720 SW Macadam Ave. Suite 125 Portland, OR 97219	Project: Barry 2022 Project Number: 201114-01.02 Task 09 Project Manager: Masakazu Kanematsu	Report ID: A2E0493 - 06 02 22 1444
--	---	---

REPORTING NOTES AND CONVENTIONS (Cont.):

Blanks (Cont.):

Sample results flagged with a 'B' or 'B-02' qualifier are potentially biased high if the sample results are less than ten times the level found in the blank for inorganic analyses, or less than five times the level found in the blank for organic analyses.

'B' and 'B-02' qualifications are only applied to sample results detected above the Reporting Level.

Preparation Notes:

Mixed Matrix Samples:

Water Samples:

Water samples containing significant amounts of sediment are decanted or separated prior to extraction, and only the water portion analyzed, unless otherwise directed by the client.

Soil and Sediment Samples:

Soil and Sediment samples containing significant amounts of water are decanted prior to extraction, and only the solid portion analyzed, unless otherwise directed by the client.

Sampling and Preservation Notes:

Certain regulatory programs, such as National Pollutant Discharge Elimination System (NPDES), require that activities such as sample filtration (for dissolved metals, orthophosphate, hexavalent chromium, etc.) and testing of short hold analytes (pH, Dissolved Oxygen, etc.) be performed in the field (on-site) within a short time window. In addition, sample matrix spikes are required for some analyses, and sufficient volume must be provided, and billable site specific QC requested, if this is required. All regulatory permits should be reviewed to ensure that these requirements are being met.

Data users should be aware of which regulations pertain to the samples they submit for testing. If related sample collection activities are not approved for a particular regulatory program, results should be considered estimates. Apex Laboratories will qualify these analytes according to the most stringent requirements, however results for samples that are for non-regulatory purposes may be acceptable.

Samples that have been filtered and preserved at Apex Laboratories per client request are listed in the preparation section of the report with the date and time of filtration listed.

Apex Laboratories maintains detailed records on sample receipt, including client label verification, cooler temperature, sample preservation, hold time compliance and field filtration. Data is qualified as necessary, and the lack of qualification indicates compliance with required parameters.

Portland, OR 97219

Laboratory Results for: Barry

Dear Masa,

Enclosed are the results of the sample(s) submitted to our laboratory June 27, 2022
For your reference, these analyses have been assigned our service request number **K2207158**.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3376. You may also contact me via email at Mark.Harris@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Mark Harris
Project Manager

Date Received: 06/27/2022

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier II level requested by the client.

Sample Receipt:

Eleven water samples were received for analysis at ALS Environmental on 06/27/2022. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

Metals:

No significant anomalies were noted with this analysis.

Approved by _____

Date 07/19/2022

SAMPLE DETECTION SUMMARY

This form includes only detections above the reporting levels. For a full listing of sample results, continue to the Sample Results section of this Report.

Notes: Please Contact Masa (503-972-5001, mkanematsu@anchorqea.com) if running > 10X dilution. Please analyze by ICP-MS method 200.8 to achieve the MDL < 1 ppb. Some samples may have residual purple color associated with potassium permanganate (KMnO4). If those samples need to be diluted in order to not damage the ICP-MS, please do so and let Masa know the dilution factor.

Client Anchor QEA Service Request K2207158
 Received: 6/27/22 Opened: 6/27/22 By: [Signature] Unloaded: 6/27/22 By: [Signature]

- Samples were received via? **USPS** Fed Ex **UPS** **DHL** **PDX** Courier **Hand Delivered**
- Samples were received in: (circle) Cooler **Box** **Envelope** **Other** NA
- Were custody seals on coolers? **NA** **Y** N If yes, how many and where? _____
 If present, were custody seals intact? **Y** **N** If present, were they signed and dated? **Y** **N**

Temp Blank	Sample Temp	IR Gun	Cooler #/COC ID / NA	Out of temp Indicate with 'X'	PM Notified If out of temp	Tracking Number NA	Filed
<u>5.3</u>		<u>IR01</u>					

- Was a Temperature Blank present in cooler? **NA** Y **N** If yes, notate the temperature in the appropriate column above:
 If no, take the temperature of a representative sample bottle contained within the cooler; notate in the column "Sample Temp":
- Were samples received within the method specified temperature ranges? **NA** Y **N**
 If no, were they received on ice and same day as collected? If not, notate the cooler # below and notify the PM. NA **Y** **N**

- If applicable, tissue samples were received: **Frozen** **Partially Thawed** **Thawed**
- Packing material: Inserts **Baggies** **Bubble Wrap** **Gel Packs** **Wet Ice** **Dry Ice** **Sleeves** _____
 - Were custody papers properly filled out (ink, signed, etc.)? **NA** Y **N**
 - Were samples received in good condition (unbroken) **NA** Y **N**
 - Were all sample labels complete (ie, analysis, preservation, etc.)? **NA** Y **N**
 - Did all sample labels and tags agree with custody papers? **NA** Y **N**
 - Were appropriate bottles/containers and volumes received for the tests indicated? **NA** Y **N**
 - Were the pH-preserved bottles (see SMO GEN SOP) received at the appropriate pH? Indicate in the table below **NA** Y **N**
 - Were VOA vials received without headspace? Indicate in the table below. **NA** Y **N**
 - Was C12/Res negative? **NA** Y **N**
 - Were 100ml sterile microbiology bottles filled exactly to the 100ml mark? NA **Y** **N** Under filled Overfilled

Sample ID on Bottle	Sample ID on COC	Identified by:

Sample ID	Bottle Count	Bottle Type	Head-space	Broke	pH	Reagent	Volume added	Reagent Lot Number	Initials	Time

Inorganic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated value.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.
- H The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

- # The control limit criteria is not applicable.
- J The result is an estimated value.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
 - i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.
- Q See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated value.
- J The result is an estimated value.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
 - i The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.

Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/analyte is offered by that state.

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit

Laboratory Results for: Barry

Dear Masa,

Enclosed are the results of the sample(s) submitted to our laboratory June 27, 2022
For your reference, these analyses have been assigned our service request number **K2207159**.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3376. You may also contact me via email at Mark.Harris@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Mark Harris
Project Manager

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier II level requested by the client.

Sample Receipt:

Twelve water samples were received for analysis at ALS Environmental on 06/27/2022. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

Metals:

No significant anomalies were noted with this analysis.

Approved by _____

Date 07/19/2022

SAMPLE DETECTION SUMMARY

This form includes only detections above the reporting levels. For a full listing of sample results, continue to the Sample Results section of this Report.

Notes: Please Contact Masa (503-972-5001, mkanematsu@anchorqea.com) if running > 10X dilution. Please analyze by ICP-MS method 200.8 to achieve the MDL < 1 ppb. Some samples may have residual purple color associated with potassium permanganate (KMnO4). If those samples need to be diluted in order to not damage the ICP-MS, please do so and let Masa know the dilution factor.

Inorganic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated value.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.
- H The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

- # The control limit criteria is not applicable.
- J The result is an estimated value.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
 - i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.
- Q See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated value.
- J The result is an estimated value.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
 - i The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

Wyoming (EPA Region 8)	https://www.epa.gov/region8-waterops/epa-region-8-certified-drinking-water	-
Kelso Laboratory Website	www.alsglobal.com	NA

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.

Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/analyte is offered by that state.

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Laboratory Results for: Barry

Dear Masa,

Enclosed are the results of the sample(s) submitted to our laboratory June 27, 2022
For your reference, these analyses have been assigned our service request number **K2207160**.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3376. You may also contact me via email at Mark.Harris@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Project: Barry
Sample Matrix: Water

Service Request: K2207160
Date Received: 06/27/2022

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier II level requested by the client.

Sample Receipt:

Eleven water samples were received for analysis at ALS Environmental on 06/27/2022. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

Metals:

No significant anomalies were noted with this analysis.

Noel D. O'Connell

SAMPLE DETECTION SUMMARY

This form includes only detections above the reporting levels. For a full listing of sample results, continue to the Sample Results section of this Report.

Notes: Please Contact Masa (503-972-5001, mkanematsu@anchorqea.com) if running > 10X dilution. Please analyze by ICP-MS method 200.8 to achieve the MDL < 1 ppb. Some samples may have residual purple color associated with potassium permanganate (KMnO4). If those samples need to be diluted in order to not damage the ICP-MS, please do so and let Masa know the dilution factor.

Inorganic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated value.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.
- H The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

- # The control limit criteria is not applicable.
- J The result is an estimated value.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
 - i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.
- Q See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated value.
- J The result is an estimated value.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
 - i The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Matrix Spike and Matrix Spike Duplicate Data is presented for information purposes only. The matrix may or may not be relevant to samples reported in this report. The laboratory evaluates system performance based on the LCS and LCSD control limits.

Laboratory Results for: Barry

Dear Masa,

Enclosed are the results of the sample(s) submitted to our laboratory June 27, 2022
For your reference, these analyses have been assigned our service request number **K2207161**.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3376. You may also contact me via email at Mark.Harris@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Mark Harris

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier II level requested by the client.

Sample Receipt:

Eleven water samples were received for analysis at ALS Environmental on 06/27/2022. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

Metals:

No significant anomalies were noted with this analysis.

Approved by *Noel D. Dault*

Date 07/19/2022

SAMPLE DETECTION SUMMARY

This form includes only detections above the reporting levels. For a full listing of sample results, continue to the Sample Results section of this Report.
