Earth Science and Environmental Engineering

CERTIFICATION STATEMENT

This *2023 Annual Groundwater Monitoring and Corrective Action Report, Alabama Power Company - Plant Gorgas Ash Pond* has been prepared in accordance with the United States Environmental Protection Agency's coal combustion residual rule (40 CFR Part 257, Subpart D), ADEM Administrative Order (AO) No. 18-096-GW, and ADEM Admin. Code Ch. 335-13-15 under the supervision of a licensed professional engineer in the State of Alabama. As such, I certify that the information contained herein is true and accurate to the best of my knowledge.

EXECUTIVE SUMMARY

In accordance with the United States Environmental Protection Agency (EPA) coal combustion residual (CCR) rule (40 CFR Part 257, Subpart D), the State of Alabama Department of Environmental Management (ADEM) Admin. Code Ch. 335-13-15, and ADEM Administrative Order (AO) No. 18-096-GW, this 2023 Annual Groundwater Monitoring and Corrective Action Report has been prepared to document the 2023 semi-annual groundwater monitoring activities at the Plant Gorgas Ash Pond (Ash Pond) and to satisfy the requirements of 40 CFR § 257.90I, ADEM Admin. Code r. 335-13-15-.06(1)(e), and Part E of AO No. 18-096-GW. Semi-annual monitoring and associated reporting for Plant Gorgas Ash Pond is performed in accordance with the monitoring requirements in 40 CFR § 257.90 through § 257.98 and ADEM Admin. Code r. 335-13-15-.06(1) through r. 335-13-15-.06(9).

The CCR unit began the monitoring period in corrective action pursuant to 40 CFR § 257.98, ADEM Admin. Code r. 335-13-15-.06(9), and AO No. 18-096-GW. Statistically significant increases (SSI) of Appendix III constituents over background were identified in the results of the first detection monitoring event, and assessment monitoring was initiated in January 2018. Statistically significant levels (SSL) of Appendix IV parameters above groundwater protection standards (GWPS) were identified while in assessment monitoring. Consequently, an assessment of corrective measures (ACM) was initiated on January 13, 2019, and completed on June 12, 2019, according to the requirements of 40 CFR § 257.96, ADEM Admin. Code r. 335-13-15-.06(7), and AO No. 18-096-GW. The ACM was subsequently submitted to ADEM and posted to the Ash Pond (Site) CCR compliance website. A public meeting to discuss the ACM was held on July 1, 2020.

Since the submittal of the ACM, extensive Site investigations have been performed to select effective corrective measures to address SSL above GWPS. A Groundwater Remedy Selection Report was prepared to meet the requirements of 40 CFR § 257.97, ADEM Admin. Code r. 335-13-15-.06(8), and Part C of AO No.18-096-GW and submitted December 17, 2021. Subsequently, within 90 days of remedy selection, a Corrective Action Groundwater Monitoring Program describing implementation and monitoring of selected remedies at the Site was submitted on March 15, 2022.

SSL of Appendix IV parameters arsenic, lithium, and molybdenum were identified from statistical analysis during the first and second semi-annual monitoring events of 2023. The following summarizes results and activities conducted in 2023:

- Submitted 2022 Annual Groundwater Monitoring and Corrective Action Report on January 31, 2023.
- Completed the first 2023 semi-annual groundwater monitoring event between March 6, 2023, and March 28, 2023, and submitted the first 2023 Semi-annual Groundwater Monitoring and Corrective Action Report on July 31, 2023.
- Research for the in-situ groundwater treatment of Site constituents of interest (COI) as part of a Pre-Design Investigation (PDI) for a Permeation Grouting and/or Geochemical Injection Pilot Program. Geochemical manipulation was originally not selected as corrective measure, however, because it may be a viable remedial technology it has been included as part of the PDI. This research included:
    - Completed all screening batch tests and optimization batch tests for laboratory treatability studies. The findings are summarized in the Laboratory Treatability Study Results for the Plant Gorgas Ash Pond report (Appendix E).
    - Selected locations for pilot tests based on stratigraphy, COI in groundwater, bedrock characterization data, and accessibility.
    - Performed preliminary study of the hydraulics of reagent injections, including sustainable injection rates and distances of treatment solution delivery within the fractured bedrock.
- Completed the second semi-annual monitoring event between August 30, 2023, and September 19, 2023.

The CCR unit concluded the monitoring period in corrective action. APC has begun implementing the selected groundwater remedies identified in the Groundwater Remedy Selection Report submitted to ADEM in December 2021 and detailed in the Corrective Action Groundwater Monitoring Program document. The following monitoring-related activities are planned for the CCR unit:

- Conduct the PDI field work to remediate groundwater at two potential remediation areas (PRA) of the Site, to provide data for predictive groundwater modeling and to inform the design of pilot tests beginning in February 2024. The scope of work developed for the PDI includes the following:
    - Update the current Site hydrogeologic conceptual site model (HCSM).
    - Perform surface geophysical survey consisting of Electrical Resistivity Imaging (ERI) and Electrical Self-Potential (SP) methods for identifying the most advantageous location for borings.

  - Advance two exploratory borings and collect detailed subsurface data to include lithologic descriptions; soil, groundwater, and rock core sample collection; packer testing; downhole geophysical logging; and lugeon hydraulic conductivity testing.
  - Monitor groundwater elevations.
  - Determine and implement disposition of each borehole – for example, monitoring well, tracer injection/extraction well, or temporary securement of open borehole at ground surface – to allow for future decisions on permanent borehole disposition.
  - Evaluate the need for permeation grout test borings and implement as warranted.
- Continue with implementation, evaluation, and reporting of the PDI efforts as part of the Permeation Grouting Pilot Program for the remediation of arsenic, lithium, and molybdenum. Following complete evaluation of Site data, a report summarizing the findings and recommended future remedial techniques for the Site will be prepared.
- Conduct the first semi-annual monitoring event of 2024 and submit the Semi-Annual Groundwater Monitoring and Corrective Action Report summarizing the findings to ADEM by July 31, 2024.

Pursuant to 40 CFR § 257.90(e)(6), an **Executive Summary Table** has been prepared to describe the status of groundwater monitoring and corrective action during the monitoring period for this report.

Executive Summary Table.
Monitoring Period Summary
Plant Gorgas - Ash Pond

Assessment Monitoring Initiated: January 15, 2018
Monitoring Period: January 1 - December 31, 2023
Beginning Status: Corrective Action
Ending Status: Corrective Action

Statistical Analysis Results *

Appendix III SSIs

Parameter	Wells
Boron	GS-AP-MW-6S, GS-AP-MW-6D, GS-AP-MW-7, GS-AP-MW-21, and GS-AP-MW-21V.
Calcium	GS-AP-MW-6S, GS-AP-MW-6D, GS-AP-MW-9V, and GS-AP-MW-19.
Chloride	GS-AP-MW-2, GS-AP-MW-6S, GS-AP-MW-6D, GS-AP-MW-7, GS-AP-MW-9V, GS-AP-MW-12V, GS-AP-MW-15, GS-AP-MW-15V, GS-AP-MW-17, GS-AP-MW-19, GS-AP-MW-21, and GS-AP-MW-21V.
Fluoride	GS-AP-MW-2, GS-AP-MW-15, and GS-AP-MW-21V
pH	GS-AP-MW-2, GS-AP-MW-12, GS-AP-MW-12V, GS-AP-MW-15, GS-AP-MW-17, and GS-AP-MW-21
Sulfate	GS-AP-MW-6S, GS-AP-MW-6D, GS-AP-MW-7, GS-AP-MW-9V, GS-AP-MW-15V, GS-AP-MW-21, GS-AP-MW-21V.
TDS	GS-AP-MW-2, GS-AP-MW-9V, GS-AP-MW-15, GS-AP-MW-15V, GS-AP-MW-17, and GS-AP-MW-21, GS-AP-MW-21V.

Appendix IV SSLs

Parameter	Wells
Arsenic	GS-AP-MW-6D, GS-AP-MW-7, GS-AP-MW-13R, and GS-AP-MW-46.
Lithium	GS-AP-MW-6D, GS-AP-MW-7, and GS-AP-MW-15.
Molybdenum	GS-AP-MW-7.

1.0 INTRODUCTION

In accordance with the United States Environmental Protection Agency (EPA) coal combustion residual (CCR) rule (40 CFR Part 257, Subpart D), the State of Alabama Department of Environmental Management (ADEM) Admin. Code Ch. 335-13-15, and ADEM Administrative Order (AO) No. 18-096-GW, this 2023 Annual Groundwater Monitoring and Corrective Action Report has been prepared to document semi-annual groundwater monitoring activities at the Plant Gorgas Ash Pond (Ash Pond) and to satisfy the requirements of 40 CFR § 257.90(e), ADEM Admin. Code r. 335-13-15-.06(1)(e), and Part E of AO No. 18-096-GW. Semi-annual monitoring and associated reporting for the Ash Pond (Site) is performed in accordance with the monitoring requirements in 40 CFR § 257.90 through § 257.98 and ADEM Admin. Code r. 335-13-15-.06(1) through r. 335-13-15-.06(9).

Semi-Annual Groundwater Monitoring and Corrective Action Reports include an update on groundwater delineation activities completed since the submittal of the Facility Plan for Groundwater Investigation (November 13, 2018) and corrective action activities completed since the submittal of the Corrective Action Groundwater Monitoring Program (March 15, 2022).

2.0 MONITORING PROGRAM STATUS

The Site is currently in corrective action and APC will continue implementation of the selected groundwater remedies identified in the Groundwater Remedy Selection Report and the Corrective Action Groundwater Monitoring Program. In accordance with 40 CFR § 257.94(e) and ADEM Admin. Code r. 335-13-15-.06(5)(e), APC implemented assessment monitoring in January 2018. SSL of Appendix IV parameters were identified at the Gorgas Ash Pond during assessment sampling events. Pursuant to 40 CFR § 257.95(g)(3)(i) and ADEM Admin. Code r. 335-13-15-.06(6)(g)4.(i), APC completed an ACM in accordance with 40 CFR § 257.96, ADEM Admin. Code r. 335-13-15-.06(7), and AO No. 18-096-GW. The ACM was completed June 12, 2019, and a public meeting was held to discuss the ACM on July 1, 2020.

In accordance with 40 CFR § 257.97(a), ADEM Admin. Code r. 335-13-15-.06(8)(a), and Part C of Administrative Order No. 18-096-GW, Semi-Annual Remedy Selection and Design Progress Reports were submitted beginning in December 2019. The semi-annual progress reports were prepared to describe the progress made in selecting and designing a remedy for the Site. A Groundwater Remedy Selection Report was prepared and submitted on December 17, 2021, to meet the requirements of 40 CFR § 257.97, ADEM Admin. Code r. 335-13-15-.06(8), and Part C of AO No. 18-096-GW. Subsequently, within 90 days of remedy selection, a Corrective Action Groundwater Monitoring Program was developed and submitted on March 15, 2022.

In accordance with 40 CFR § 257.98 and ADEM Admin. Code r. 335-13-15-.06(9), APC will continue semi-annual groundwater monitoring, including all monitoring wells in the certified groundwater monitoring system and any well installed to characterize the horizontal and vertical extent of SSL. APC will continue with implementation of the groundwater remedies described in the Groundwater Remedy Selection Report and Corrective Action Groundwater Monitoring Program document.

3.0 SITE LOCATION AND DESCRIPTION

The Alabama Power Company (APC) William Crawford Gorgas Electric Generating Plant (Plant Gorgas) is in southeastern Walker County, Alabama, approximately 15 miles south of Jasper, at 460 Gorgas Road, Parrish, AL 35580. Based on visual inspection of USGS topographic quadrangle maps and GIS plant boundary files provided by SCS, the plant occupies portions of Sections 7, 8, 9, 16, 17, 18, 19, 20, 21, 28 and 29, Township 16 South, Range 6 West and Section 12, 13 and 24, Township 16 South, Range 7 West (USGS, 1975; USGS, 1983). The Ash Pond is located southeast of the main plant on the opposite side of the Black Warrior River. **Figure 1**, **Site Location Map**, depicts the location of the Plant and Ash Pond with respect to the surrounding area.

3.1 PHYSICAL SETTING

Plant Gorgas is in the Black Warrior River basin, an area typified by moderate relief, with river and stream valleys having dendritic drainage patterns. Elevations at the site range from approximately 260 feet above mean sea level (MSL) near the Mulberry Fork to over 600 feet MSL east of the Ash Pond. The Ash Pond occupies a localized, narrow valley where ground elevations are higher to the west, north, and east of the Ash Pond. Ground elevations typically range between 400 and 600 feet MSL and can have steep slopes down to the Ash Pond, which historically resides around elevation 380 ft MSL. **Figure 2**, **Site Topographic Map**, provides the topography of the Site.

3.2 SITE GEOLOGY AND HYDROGEOLOGY

Plant Gorgas lies in the Warrior Basin physiographic region (Sapp and Emplaincourt, 1975), a late Paleozoic basin formed as a result of flexure and sediment loading associated with Appalachian and Ouachita orogenies. The bedrock geology is dominated by clastic sedimentary rocks of the Upper Pottsville Formation as shown on **Figure 3**, **Site Geologic Map** (GSA, 2010b). The Upper Pottsville formation directly underlies Plant Gorgas and extends down to a depth of approximately 2,100 feet below ground surface. This formation is characterized by cyclic sequences (cyclothems) of marginal marine shale/claystone, siltstone, sandstone, conglomerates, and individual coal beds. These depositional cyclothems reflect the sediment balance controlled b^{y} 4th o^{r} 5th order glacial eustasy, continued basin evolution, and variations in sedimentation rates (Pashin and Raymond, 2004). Deeper stratigraphy is marked by carbonates, shales, chert, and sandstones of Mississippian to Cambrian age (Raymond et al., 1988).

The Plant Gorgas Ash Pond is directly underlain by rocks belonging to the Pratt Coal Group (Ward II et al., 1989) of the Lower Pottsville Formation. In general, the Pratt Coal Group consists of mudstone, shale, fine-grained sandstone, and interbedded coal in fining-upward sequences. Stratigraphically, at the Site, the Pratt Coal Group can generally be characterized as (1) a lower coal measures interval, (2) a predominantly mudstone or shale interval, and (3) an upper sandstone interval. As indicated on geologic cross-sections provided in this report, only the lower coal measures interval and mudstone/shale interval intersect or underlie the Ash Pond, as the upper sandstone interval (as well as Cobb Group strata) typically forms the caprock for ridges on either side of the Ash Pond.

The Pratt Coal Group generally contains three named coal seams, each separated by 25 to 50 feet of intra-burden. In descending order, they are the Pratt, Nickel Plate, and American coal seams. Locally, Pratt Coal Group strata gently dip to the south and south-southwest. As noted in the Supplemental Site Hydrogeological Characterization Report submitted in March 2021 (SCS, 2021) local variations in dip direction and magnitude are observed at the site and may be attributable to localized fault displacement, elevations at the time of deposition, and potential presence of a synclinal structural feature. The top of the Pratt Coal Group occurs at depths between 70 and 225 feet below ground surface or at elevations between 350 and 240 feet MSL. Pratt coals generally fit the following patterns:

- Beneath the site, the Pratt coal is generally 3 to 4 feet thick and overlies the Nickel Plate Seam, separated by a 10- to 12-feet sequence of claystone grading downward to sandstone.
- Locally, the Nickel Plate seam is not very prominent and is generally under 1.5 feet in thickness.
- The American seam generally resides 15 to 25 feet beneath the Nickel Plate Seam and is separated primarily by a sandstone bed. The American seam generally thickens towards the south where it was underground mined (Maxine Mine).

Figures 4A-4H, Geologic Cross-Sections, provide illustrations of the Pottsville strata underlying the site.

The Pottsville aquifer system is the primary aquifer in Walker County. Although on a regional scale there are other aquifer systems in the vicinity of Plant Gorgas, the Pottsville aquifer system is the most significant. The nearest exposure of the Valley and Ridge aquifer system occurs in central Jefferson County, approximately 25 miles east of Plant Gorgas. The nearest exposure of the Tuscaloosa aquifer system occurs in northwesternmost Walker County, approximately 30 miles northwest of Plant Gorgas. The Tuscaloosa aquifer system is not considered a primary source of groundwater in Walker County (Stricklin, 1989).

The Pottsville aquifer system is composed primarily of Pennsylvanian-aged sandstones, shales, conglomerates, and coal. Groundwater flow primarily occurs through coal seams or rock fabric discontinuities such as bedding planes and fractures. Groundwater in the Pottsville aquifer system is commonly regarded as confined due to large permeability contrasts within the aquifer (Stricklin, 1989). Recharge to the Pottsville formation is largely through infiltration of precipitation and to a lesser extent, downward seepage of river water at hydraulically favored locations.

Regionally, recharge is accommodated largely by fracture-enhanced permeability. Major recharge zones to the Pottsville Formation are related to major geologic structures such as large fault zones or along systematic fold axes (Pashin, 2007). Although the Pottsville aquifer system is the primary aquifer in Walker County, groundwater use is relatively limited. According to O'Rear et al., 1972, groundwater use accounted for approximately 15% of total water use in Walker County in 1966. By 2005, groundwater use had declined to less than 1% of total water use in Walker County, or 1.14 million gallons per day (MGD) of groundwater out of a total water use of 969.5 MGD (USGS, 2005).

3.2.1 Pottsville Formation – Rock Chemistry

Published data indicate that elevated arsenic concentrations occur in the Southern Appalachian coal strata where site monitoring wells are screened. Numerous publications document elevated trace metals in Pottsville and Pottsville coal strata (Kolker et al., 1999, Diehl et al., 2004, Goldhaber et al., 2002). For instance, according to the USGS National Coal Data System (NRCDS), the average concentration of arsenic (72 ppm) in the Pottsville coal strata is three times that of the average of other coal basins (Bragg et al., 1997). Of the U.S. coal analyses for arsenic that are at least three standard deviations above the mean, approximately 90% are from the coal fields of Alabama (Diehl et al., 2004). The United States Geological Survey (USGS) maintains an inventory of coal quality that includes trace metal concentration data. It shows arsenic concentrations range from 1.08 milligrams per kilograms (mg/kg) to 611.0 mg/kg with a mean of 47 mg/kg for Walker County (USGS Coal Quality Database).

Similarly, 75 Pratt Coal Group samples (Pratt, Nickel Plate, and American coal seams) analyzed by the USGS and inventoried in the USGS National Coal Data System (NRCDS) showed the following ranges of other trace metals:

- Boron – 6.3 to 83.6 ppm (average of 35 ppm).
- Cobalt – 1.6 to 19.8 ppm (average of 8 ppm).
- Molybdenum – 0.8 to 22.2 ppm (average of 5 ppm).
- Lithium – 1.4 to 128 ppm (average of 28 ppm).

Bulk geochemical analyses of Pottsville stratigraphy from the Site and of the Pratt and American coal seams from Plant Gorgas were conducted on recovered core. The data reflect arsenic concentrations between 4.9 mg/kg and 32.6 mg/kg in siltstone/mudstones and concentrations of 28.9 and 384.4 mg/kg in the two coal seams analyzed. The average arsenic concentration was roughly 34 mg/kg in these samples tested, which is in good agreement with data observed in the USGS NCRDS.

Similarly, 17 Pratt Coal Group samples collected from the Site provided the following ranges of other trace metals:

- Boron – 20.8 to 114 ppm (average of 49 ppm).
- Cobalt – 4.2 to 18.2 ppm (average of 14 ppm).
- Molybdenum – 1.0 to 4.4 ppm (average of 2 ppm).

During the first part of 2022, a robust study of the composition of Pottsville Formation (Pratt, Gillespy, and Mine Spoil derivatives) at the nearby Plant Gorgas Gypsum Pond found the following concentrations in rock and mine spoil materials:

- Lithium – 30 to 367 ppm (average of 128 ppm).
- Arsenic – 7 to 79 ppm (average of 32 ppm).
- Molybdenum – 0.67 to 9.8 ppm (average of 3 ppm).

Trace metal enrichment and pyrite origins have been linked to post-depositional (post-coalification) deformation and trace metal laden hydrothermal fluids upwelling during Alleghanian tectonism. Diehl et al., (2004) and Goldhaber et al., (2002) describe “high-pyrite” coals as a source of elevated arsenic and other trace metals. In these publications, pyrite occurrence is observed within coal banding, woody cellular fill structures, mineral overgrowths, and structural fills such as veins and microfaults. The geogenic lithium study at the Plant Gorgas Gypsum Pond (July 2022), observed strong correlations between mica and clay mineral abundance and lithium concentrations, as well as secondary lithium associated primarily with sorption on iron oxides.

In areas where strip mining occurred (north of ash pond dam, west of the ash pond), the process of strip mining and backfilling these materials can increase the availability of trace metals to groundwater. These mining processes and practices lead to the physical weakening and enhanced weathering of rock which, along with changed hydrodynamics, can lead to elevated and highly variable concentrations across a historic mine site. Increased acidity in groundwater, when present, can also help to mobilize constituents – especially in mine spoil materials.

3.2.2 Uppermost Aquifer

The Pottsville aquifer system is the uppermost aquifer beneath the Site for groundwater monitoring purposes. Groundwater occurs in the Pratt Coal Group of the Upper Pottsville Formation at the Site. The primary occurrences of groundwater in the uppermost aquifer are: (1) coal seams and (2) rock fabric discontinuities such as bedding planes and joints. Fractured intervals are sparse across the Site as defined by caliper logging, and tend to occur with greater density in the upper 100 feet of rock. Decreases in fracture density at depth can limit flow and form a base to the aquifer system.

Groundwater yield at the Site is considered low and typical of the Pottsville aquifer system in areas without major geologic structures. Monitoring wells were generally screened in the Pratt coal seam or across groundwater yielding fractures. Depths to groundwater-producing zones were highly variable at the site and typically ranged from 30 to 240 feet BGS. Groundwater yielding zones were identified using caliper, natural gamma, normal resistivity, fluid temperature, fluid resistivity logs, and heat pulse flowmeter logs. Packer testing was used in select borings to further enhance characterization.

Based on published data, groundwater quality produced from the Pottsville Formation can be characterized by high concentrations of sulfate, iron, and other trace metals (Jennings and Cook, 2010). Trace metals in Pottsville Formation groundwater are associated with sulfide minerals contained in organic-rich strata (e.g., mudstones and coal seams) and siliceous/carbonate healed fractures and joints. Trace element enrichment is the result of migrating hydrothermal fluids generated during the late Paleozoic Allegheny orogeny (Diehl et al., 2004). Arsenic, antimony, molybdenum, selenium, copper, thallium, and mercury are elevated in Warrior Basin coal strata (Goldhaber et al., 2002).

3.2.3 Flow Interpretation

Groundwater flow occurs primarily by means of fracture flow, where groundwater flows along more conductive secondary discontinuities in the rock mass such as joints or cleat fabric in coal seams. Groundwater flow in rock aquifer systems is influenced by the structural strike and dip of bedding planes to varying degrees depending on dip magnitude, relative resistance to flow in bed-parallel and cross-bed directions, and orientations with respect to hydraulic gradient. In some cases, groundwater does not flow exactly perpendicular to the head gradients illustrated by potentiometric surface contours in a process called flow distortion. Fracture flow in complex geologic media such as the heterogeneous Pottsville Formation can be complex. Groundwater in the Pottsville aquifer is most commonly regarded as confined due to large permeability contrasts within the aquifer (Stricklin, 1989). The Pottsville at the Site is probably better described as a series of discrete, confined to semi-confined, groundwater yielding zones where groundwater elevations can vary significantly laterally and vertically, depending on the heterogeneity of the lithology and degree of fracture network interconnectivity.

At the Site, the groundwater flow regime is grouped into three general flow systems: (1) shallow water table flow system, (2) Pratt Coal flow system, and (3) American Coal flow system. North of the dam, groundwater occurrence and monitoring also occurs in discrete intervals of the Gillespy Coal Group. These intervals are absent or are low yielding across other areas of the Site. Each flow system displays unique hydraulic head conditions, indicating that confined or semi-confined conditions exist among flow systems.

At higher stratigraphic intervals (water table flow system), groundwater flows towards the Ash Pond or other surface water bodies. This flow system is driven by gravity and mimics the topography of the site. Within deeper rock strata such as coals of the Pratt Group (Pratt Coal Group or deep bedrock flow system), groundwater flows radially away from the site.

Based on structural elevations and dip, the American coal seam would intercept the base of the pond between the ash pond and splitter dike, and the Pratt coal seam would intercept the base of the pond near its geographic center near wells GS-AP-MW-12 and GS-

AP-MW-1. The more permeable coal measures underlie the northern half of the ash pond before dipping below its base towards the south. The southern half of the ash pond is underlain by mudstone/shale interval. Radial flow is interpreted to emanate from this intersection.

Conceptually, there is likely to be little hydraulic communication with strata deeper than the sandstone unit immediately underlying the American Coal Seam (American Coal Flow System), except for the far northern portion of the Ash Pond. Below this interval, a low permeability mudstone to interbedded mudstone-sandstone unit likely forms a barrier to vertical migration of groundwater. Hydraulic conductivity values in the 10^{-7} centimeter per second (cm/s) range are reported for shales at the site as derived from packer testing. This interval reflects the transition to the Gillespy Coal Group.

To the north and underlying the Ash Pond dam, strong hydraulic gradients likely force groundwater along vertical fractures and bedding planes through the upper part of the Gillespy Coal Group. Geophysical and hydrophysical logs for well locations north of the dam suggest there are three to four discrete bedding planes occurring between 30 and 90 ft BGS that transmit groundwater. The most prominent, typically occurring at a depth of 49 to 56 ft BGS, is likely a Gillespy equivalent approximately 100 feet below American Coal Seam. These discrete zones occur in the upper part of the Gillespy Coal Group and appear to dip approximately 2.1° southwest. Geophysical signatures of flow diminish greatly between and below these intervals. Due to groundwater not being encountered during the attempted installation of deeper well locations coupled with site geophysical logs suggest that there is little or no groundwater flow at elevations below 160 feet MSL. Strong upward vertical gradients are observed in paired well locations (see groundwater elevations in MW-6S/6D and MW-41HS/HD pairs) installed north of the ash pond dam. Potentiometric data suggests upward vertical flows along with northerly lateral flow.

Forty-three packer tests were conducted, resulting in a range of hydraulic conductivity (k) values from an estimated low of 7×10^{-7} cm/sec to a high of 4×10^{-3} cm/sec, with most tests (31) in the moderate range (10^{-5} cm/sec to 10^{-4} cm/sec), 2 test results in the more permeable range (10^{-3} to 10^{-2} cm/sec), and 10 test results in the less permeable range (10^{-6} cm/sec). There is a general trend of decreasing estimated hydraulic conductivity with depth. Packer test results vary over four orders of magnitude. Test intervals at the high end of the data range are associated with weathered discontinuities (fractures and joints). Moderate values are associated with minor fractures or bedding planes. The lowest values are associated with more shale intervals without substantial fractures. Test intervals with coal seams are in the moderate to high end of the data range.

3.3 GROUNDWATER MONITORING SYSTEM

Pursuant to 40 CFR § 257.91 and ADEM Admin. Code r. 335-13-15-.06(2), Plant Gorgas has installed a groundwater monitoring network to monitor groundwater flow within the uppermost aquifer. The certified groundwater monitoring network for the Plant Gorgas Ash Pond is designed to monitor groundwater passing the waste boundary of the CCR unit. Wells were sited to serve as upgradient and downgradient monitoring locations based on groundwater flow direction as determined by the potentiometric surface elevation contour maps. All groundwater monitoring wells were designed and constructed using “Design and Installation of Groundwater Monitoring Wells in Aquifers,” ASTM Subcommittee D18.21, as a guideline.

3.3.1 Monitoring Wells

Well locations at the site are designated as upgradient, downgradient, piezometer (water-level only), vertical delineation, and horizontal delineation. The following subsections provide a summary of well designations and if applicable, changes or modifications to the well network or designations. As noted in the site Groundwater Monitoring Plan, modifications to the well network or designation must first be approved by ADEM. The location and designation of Site wells are presented in **Figure 5, Monitoring Well Location Map.**

3.3.1.1 Upgradient Wells

To evaluate upgradient well locations at the Site, groundwater elevations and CCR indicator parameters were reviewed. As described in **Section 3.2.3**, there are multiple groundwater flow regimes within the Pottsville Formation at the Site: (1) an upper groundwater flow system found at higher elevations (water table flow system) and (2) a deeper groundwater flow system composed of Pratt Coal Group strata that also represents the uppermost aquifer beneath the Ash Pond.

There are three upgradient compliance well locations (GS-AP-MW-8, GS-AP-MW-13, and GS-AP-17V) that are currently being used for statistical comparison of groundwater quality. Compliance wells GS-AP-MW-8 and GS-AP-MW-13 are spatially situated near downgradient compliance wells but are screened across fractures that occur at higher elevations and are not hydraulically connected to downgradient flow. Compliance well GS-AP-MW-17V was intended to be utilized as a vertical delineation well. However, the underlying Maxine Mine was encountered during installation and the well was subsequently screened at a higher elevation. GS-AP-MW-17V was redesignated as an upgradient compliance well in the Fall of 2021. In addition, replacement monitoring well GS-AP-MW-18R was installed across a shallow water-bearing fracture and was subsequently designated as an upgradient monitoring well in the Fall of 2021. **Table 1a**, **Compliance Monitoring Well Network Details** summarizes compliance well construction characteristics and the lithology (flow system) surrounding the screened interval.

3.3.1.2 Downgradient Wells

Borehole geophysics, hydrophysical logging, and packer testing were used to determine well screen intervals. These logging techniques identify groundwater flow zones in open boreholes and are optimally suited for use in low-yielding, fractured rock media. Heat-pulse flowmeter logging or packer testing were used to assess or further evaluate potential flow zones indicated by hydrophysical logging tools. If multiple flow zones were identified, then paired wells were installed to screen both zones.

Preferential groundwater flow away from the site, if existing, occurs within zones of enhanced permeability, such as cleated coals or zones of intersecting rock discontinuities, spatially located lateral to or beneath the base of the Ash Pond. Strata of the Pratt Coal Group are the uppermost aquifer lateral to or beneath the base of the Ash Pond, as indicated by borehole logging and geophysics. Downgradient monitoring wells are installed in the Pratt Coal Group, and generally across the Pratt or American Coal Seam.

To the north and beneath the Ash Pond dam, Pratt Coal Group strata exist above the ground surface or are mined out. In these areas, downgradient monitoring well locations were installed across the uppermost groundwater yielding fractures identified by borehole geophysics and hydrophysical logging and generally correspond to the transition from Pratt to Gillespy Coal Groups.

There are currently 27 downgradient compliance wells at the Gorgas Ash Pond that are being used for statistical comparison of groundwater quality. During the Fall of 2021, several delineation wells including GS-AP-MW-9V, GS-AP-MW-12V, GS-AP-MW-15V, and GS-AP-MW-21V were redesignated as downgradient compliance wells to satisfy compliance monitoring needs in the American Flow System. **Table 1a** summarizes compliance well construction characteristics and the lithology (flow system) surrounding the screened interval.

3.3.1.3 Delineation Wells

Pursuant to 40 CFR § 257.95(g)(1), ADEM Admin. Code r. 335-13-15-.06(6)(g)2., and AO 18-096-GW, additional monitoring wells have been installed to characterize the horizontal and vertical extent of GWPS exceedances identified during assessment monitoring. Three phases of field investigation have occurred since late 2018 to explore potential impacts to groundwater. In total, there are 7 vertical delineation wells and 22 horizontal delineation wells. Former piezometers GS-AP-PZ-16, GS-AP-PZ-18, and GS-AP-PZ-22 were redesignated as vertical delineation wells in 2020. Due to its location relative to ongoing closure activities, GS-AP-PZ-18 was abandoned in 2021 and promptly replaced with GS-AP-PZ-18R. Each of the on-site delineation wells is sampled for Appendix III and Appendix IV constituents on a semi-annual basis. However, the analytical dataset compiled for each of the on-site delineation wells is not utilized for statistical analysis. **Table 1b, Delineation Well Network Details**, summarizes delineation well construction characteristics and the lithology (flow system) surrounding the screened interval.

3.3.1.4 Piezometers

There are currently nine piezometers at the site including GS-AP-MW-4, GSP-AP-MW-7V, GS-AP-MW-7VR, GS-AP-MW-16S, GS-AP-MW-20, GS-AP-MW-15H, GS-AP-MW-30H, GS-A-MW-30HS, and GS-AP-MW-39H. Historically, water-level only piezometers were well locations that (1) did not yield sufficient groundwater recharge for sampling or (2) encountered underground mine workings not suitable for compliance sampling.

As noted in the facility's Groundwater Monitoring Plan dated March 2021, monitoring well location GS-AP-MW-16S was proposed for inclusion in the facility's groundwater monitoring network as an upgradient monitoring well. The well's upgradient location relative to the regulated unit, coupled with the historically low concentrations of Appendix III indicator parameters, suggested the groundwater in well GS-AP-MW-16S would be representative of background conditions. However, the historical analytical data compiled for GS-AP-MW-16S suggest that it is geochemically similar to downgradient compliance wells GS-AP-MW-15, GS-AP-MW-15V, and GS-AP-MW-21. As noted in the facility's ASD dated July 2021, the elevated pH and lithium concentrations observed in downgradient compliance wells GS-AP-MW-15, GS-AP-MW15V, and GS-AP-MW-21 are likely attributed to the natural release of lithium from underlying coal seams. Additional assessment of the area immediately surrounding piezometer GS-AP-MW-16S is planned to verify if the elevated pH and lithium concentrations are representative of background conditions. **Table 1c**, **Piezometer Well Network Details** summarizes piezometer installation data, including piezometer construction details and the lithology (flow system) within the screened interval. The locations of each of the on-site piezometers is presented on **Figure 5**.

3.3.1.5 Monitoring Well Replacement and Abandonment

Due to their location in proximity to ash pond closure activities, compliance wells GS-AP-MW-9, GS-AP-MW-11, GS-AP-MW-13, and GS-AP-MW-14 and piezometers GS-AP-MW-5 and GS-AP-MW-10 were abandoned in July 2019, in accordance with ADEM guidelines. In addition, compliance well GS-AP-MW-18, piezometers GS-AP-MW-1, GS-AP-MW-27H, and GS-AP-MW-37H, and vertical delineation wells GS-AP-PZ-18 and GS-AP-MW-18V, were abandoned in September of 2021 due to insufficient water production. Information related to well construction details and screened lithology for each of the former on-site monitoring wells are tabulated in **Table 1d, Abandoned Well Network Details.**

In the Fall of 2021, 12 replacement compliance wells including GS-AP-MW-1R, GS-AP-MW-5R, GS-AP-MW-9R, GS-AP-MW-10R, GS-AP-MW-11R, GS-AP-MW-13R, GS-AP-MW-14R, GS-AP-MW-18R (upgradient), GS-AP-MW-18VR, GS-AP-MW-3V, GS-AP-MW-46, and GS-AP-MW-47 were installed, surveyed, and developed in accordance with ADEM Admin. Code r. 335-13-15-.06(2)(e). In addition, delineation wells GS-AP-MW-23V, GS-AP-MW-27HR, GS-AP-MW-37HR, and GS-AP-MW-PZ-18R were installed in the Fall of 2021. Information related to well construction details and screened lithology for each of the onsite compliance and delineation wells is tabulated in **Table 1a** and **Table 1b**.

3.4 GROUNDWATER MONITORING HISTORY

In accordance with 40 CFR § 257.94(b), eight independent samples were collected from each background and downgradient well and analyzed for the constituents listed in Appendix III and IV prior to October 17, 2017. Background sampling was performed from August 2016 to June 2017. Groundwater sampling for the first detection monitoring event after the background period was performed in August 2017. Based on results of the 2017 Annual Groundwater and Corrective Action Monitoring Report, Alabama Power initiated an assessment monitoring program on January 15, 2018. Pursuant to 40 CFR §257.95(a) and ADEM Admin. Code r. 335-13-15-.06(6)(a), monitoring wells were sampled for all Appendix IV parameters in February 2018, within 90 days of initiating the assessment monitoring program.

Statistical evaluations of 2018 assessment monitoring data identified SSL of Appendix IV constituents above the GWPS, and the Site entered Assessment of Corrective Measures. Pursuant to 40 CFR §257.95(g)(1), ADEM Admin. Code r. 335-13-15-.06(6)(g)2., and AO No. 18-096-GW, additional monitoring wells (**Table 1b, Figure 5**) were installed to characterize the horizontal and vertical extent of GWPS exceedances identified during assessment monitoring in three phases of groundwater investigations between January 2019 and September 2020. These wells, along with the compliance monitoring well network, are sampled semi-annually. Occasionally, additional data collection has occurred independent of routine compliance sampling events to support continuing assessment activities at the Site.

3.4.1 Available Monitoring Data

Laboratory analytical data are available for the groundwater monitoring history outlined in **Section 3.4**. Tabulated results for Appendix III and Appendix IV constituents by monitoring well are included in **Appendix A, Analytical Data Summary**.

3.4.2 Historical Groundwater Flow

Historical groundwater elevations and potentiometric surface maps show groundwater flow patterns are consistent across monitoring events, as described in **Section 3.2.3**. As ash pond closure activities progress over the years and upon completion of closure, groundwater elevations will likely display variability representative of changing site hydrodynamics and eventually, a new set of equilibrium conditions. As this timeline progresses, groundwater elevations and trends will be qualitatively reviewed against this historical data set. Tables summarizing groundwater elevations from all groundwater monitoring events conducted at the Site are included in **Appendix B, Historical Groundwater Elevations Summary**.

3.4.3 Monitoring Variances

The groundwater monitoring program at the Site is operating under a Variance granted by ADEM on April 15, 2019, to conform State monitoring requirements under the CCR rule to Federal requirements. The variance:

1. Retains boron as an Appendix III detection monitoring parameter and excludes it as an Appendix IV assessment monitoring parameter.
2. Authorizes the use of Federally published GWPS of 0.006 milligrams per liter (mg/L) for cobalt, 0.015 mg/L for lead, 0.040 mg/L for lithium, and 0.100 mg/L for molybdenum in lieu of background where those levels are greater than background levels.

3.5 GROUNDWATER SAMPLING AND ANALYSIS

Site compliance wells are sampled semi-annually between: (1) late winter and mid spring and (2) early to late fall. The spacing between sampling events is sufficient to ensure sampling events yield independent groundwater samples and generally represent different climatic or meteorological seasons that create a degree of natural variability in groundwater quality.

During routine semi-annual monitoring events, all compliance and delineation network wells are sampled and analyzed for Appendix III and Appendix IV constituents. The following subsections summarize the sequential steps and process for the sampling, handling, transport, and analysis of compliance-related groundwater samples at the Site.

3.5.1 Groundwater Sample Collection

Prior to recording water levels and collecting samples, each well was opened and allowed to equilibrate to atmospheric pressure. Within a 24-hour period, depths to groundwater were measured to the nearest 0.01 foot with an electronic water level indicator with depth referenced from the top of the inner PVC well casing. Groundwater elevations were calculated by subtracting the depth to groundwater from surveyed top-of-casing (TOC) elevations.

Groundwater samples were collected from monitoring wells using low-flow sampling procedures in accordance with 40 CFR § 257.93(a) and ADEM Admin. Code r. 335-13-15-.06(4)(a). All monitoring wells in the compliance well network are equipped with dedicated pumps. Monitoring wells were purged and sampled using low-flow sampling procedures. In this procedure, field water quality parameters (pH, turbidity, conductivity, and dissolved oxygen) are measured to determine stabilization and groundwater samples are collected when the following stabilization criteria are met:

- 0.2 standard units for pH.
- 5% for specific conductance.
- 0.2 mg/L or 10% for DO > 0.5 mg/l (whichever is greater).
- Turbidity measurements less than 10 NTU.
- Temperature and ORP – record only, no stabilization criteria.

During purging and sampling, an in situ Aqua Troll instrument was used to monitor and record field parameters. All downhole groundwater monitoring equipment was calibrated prior to sample collection per the manufacturer's specifications outlined in the Alabama Power Environmental Affairs (EA) Water and Field Group (WFG) Technical Standard Operating Procedure, dated December 14, 2021. Once stabilization was achieved, samples were collected and submitted to the laboratory following standard chain-of-custody (COC) protocol. Field data recorded in support of groundwater sampling activities are included in **Appendix C, Laboratory and Field Records.**

3.5.2 Sample Preservation and Handling

Groundwater samples were collected in the designated size and type of laboratory-supplied containers required for specific parameters. Sample bottles were pre-preserved by the laboratory. Where temperature control was required, samples were placed in an ice-packed cooler and cooled to less than 6 °C immediately after collection. Blue ice or other cooling packs were not used for cooling samples. An ice-packed cooler was on hand when samples were collected.

3.5.3 Chain of Custody

A COC record was used to track sample possession from the time of collection to the time of receipt at the laboratory. All samples were handled under strict COC procedures beginning in the field. COC records are included with the analytical laboratory reports included in **Appendix C.**

3.5.4 Laboratory Analysis

Laboratory analyses were performed by the APC Environmental Laboratory (APCEL) in Calera, Alabama and Pace Analytical Services, LLC (Pace) in Greensburg, Pennsylvania. Both APCEL and Pace are accredited by National Environmental Laboratory Accreditation Program (NELAP) and maintain a NELAP certification for all parameters analyzed**. Table 2, Parameters and Reporting Limits**, lists assessment monitoring constituents analyzed from site groundwater samples. Groundwater data and chain of custody records for the monitoring period are presented in **Appendix C.**

3.5.5 Monitoring Period Sampling Events

As required by 40 CFR § 257.90(e) and ADEM Admin. Code r. 335-13-15-.06(1)(e), the following describes monitoring-related activities performed during the 2023 annual monitoring period. The first 2023 semi-annual monitoring was conducted between March 6 and 28, 2023 and the second semi-annual event was conducted between August 30, 2023, and September 19, 2023.

Groundwater samples were analyzed for the full list of Appendix III and Appendix IV parameters during each monitoring event. During the first and second 2023 semi-annual sampling events, additional general chemistry and monitored natural attenuation (MNA) parameters were sampled and analyzed. These analytes have been incorporated for continued evaluations of geochemical facies and their evolution over time. These analytes will also support geochemical modeling and evaluations associated with monitored natural attenuation. These parameters include:

- Calcium (filtered)
- Iron (total and dissolved)
- Silicon (total and dissolved)
- Silica (total and dissolved)
- Sodium (total and dissolved)
- Sulfide
- Potassium
- Aluminum (total and dissolved)
- Manganese
- Magnesium (total and filtered)
- Nitrate-Nitrite
- Total Alkalinity, Carbonate Alkalinity, Bicarbonate Alkalinity
- Total Organic Carbon.

All groundwater sampling activities were conducted by APC Field and Water Services. Pace Analytical Services (Greensburg) performed the laboratory analyses of Radium-226 and Radium-228 (reported combined) as well as the MNA parameter sulfide (Pace – New Orleans). APCEL performed the remaining

Appendix III and Appendix IV analyses. Analytical data from the groundwater monitoring events is included as **Appendix C** in accordance with the requirements of 40 CFR § 257.90(e)(3) and ADEM Admin. Code r. 335-13-15-.06(1)(f)3.

4.0 GROUNDWATER ELEVATIONS AND FLOW

During the first 2023 semi-annual sampling event, groundwater elevations ranged from 139.30 to 535.11 feet North American Vertical Datum of 1988 (NAVD88). **Figure 6A, Potentiometric Surface Contour Map – (Upper) Water Table Aquifer (March 6, 2023)**, **Figure 6B, Potentiometric Surface Contour Map – Pratt Aquifer (March 6, 2023)**, and **Figure 6C, Potentiometric Surface Contour Map – American Aquifer (March 6, 2023)**, depict groundwater elevations and inferred groundwater flow directions during the first semi-annual sampling event of 2023.

During the second semi-annual sampling event, groundwater elevations ranged from 122.46 to 534.64 ft feet NAVD88. **Figure 7A, Potentiometric Surface Contour Map – (Upper) Water Table (August 29, 2023)**, **Figure 7B, Potentiometric Surface Contour Map – Pratt Aquifer (August 29, 2023)**, and **Figure 7C, Potentiometric Surface Contour Map – American Aquifer (August 29, 2023)** depict groundwater elevations and inferred groundwater flow direction during the second semi-annual sampling event of 2023. **Figures 6A** and **7A** show groundwater flow towards the Ash Pond in wells screened in the upper flow system and towards Mulberry Fork in the middle to lower portions of the flow system. **Figures 6B** and **7B** show radial groundwater flow away from the Ash Pond in the Pratt Coal flow system. **Figures 6C** and **7C** show groundwater flow away from the Ash Pond in the deeper American Coal seam flow system. Recent groundwater elevation data have been tabulated and included in **Table 3, Groundwater Elevations Summary**. All historical available groundwater elevation data recorded since 2016 have been tabulated and included in **Appendix B**.

4.1 GROUNDWATER ELEVATION CHANGES

Ash Pond dewatering activities have been intermittently occurring at the Site since it was first initiated in the Spring of 2023. With an average pumping rate of 12,000 gallons per minute (GPM), the pond elevation has decreased from 382 feet to 359 feet. Consequently, groundwater elevations collected during the second semi-annual sampling event revealed an average decrease of 5.42 feet in the Upper Pratt strata. Groundwater elevation changes associated with closure-related activities will continue to be evaluated and documented.

4.2 GROUNDWATER FLOW VELOCITY CALCULATIONS

Because the geology at the Ash Pond is not homogeneous or isotropic with respect to groundwater flow, groundwater velocity calculations using derivations of Darcy's Law are not applicable to groundwater at the site. The hydrogeologic characteristics of fractured rock typically produce preferential groundwater flow paths, so groundwater velocity is much more variable than in uniform porous media such as sand. During monitoring well installation, multiple techniques were used to successfully intercept groundwater flow paths with the monitoring wells located around the Ash Pond. These flow paths correspond to coal cleats and fractures, zones of fracture concentration, bedding planes, and other discontinuities in the rock. Therefore, groundwater flow velocity at the site cannot be accurately quantified using existing site data.

Slug testing provided horizontal hydraulic conductivities for the uppermost aquifer between 1.19 x 10^{-3} cm/sec and 1.22 x 10^{-5} cm/sec with an average of 4.52 x 10^{-4} cm/sec. A total of 43 packer tests resulted in a range of hydraulic conductivity (k) values from an estimated low of 7 x 10^{-7} cm/sec to a high of 4 x 10^{-3} cm/sec, with most tests (31) in the moderate range (10^{-5} cm/sec to 10^{-4} cm/sec), 2 test results in the more permeable range (10^{-3} to 10^{-2} cm/sec), and 10 test results in the less permeable range (10^{-6} cm/sec).

5.0 EVALUATION OF GROUNDWATER QUALITY DATA

During each sampling event, quality assurance/quality control samples (QA/QC) are collected at an interval of one sample per group of 10 wells. These QA/QC samples include well duplicates, equipment blanks, and field blanks. Routine analyses of field QA/QC samples are a method for evaluating whether artificial bias could have been introduced into lab results by ways of sampling activities or equipment.

5.1 DATA VALIDATION – QUALITY ASSURANCE/QUALITY CONTROL

Analytical precision is measured through the calculation of the relative percent difference (RPD) of two data sets generated from a similar source. Here, a comparison of results between samples and field duplicate samples are used as measure of laboratory precision. Where field duplicates are collected, the RPD between the sample and duplicate sample is calculated as:

$$RPD = \frac{Conc1 - Conc2}{(Conc1 + Conc2)/2}$$

Where:

RPD = Relative Percent Difference (%)

Conc1 = Higher concentration of the sample or field duplicate

Conc2 = Lower concentration of the sample or field duplicate

Where the RPD is below 20%, the difference is considered acceptable, and no further action is needed. Where an RPD is greater than 20%, further evaluation is required to attempt to determine the cause of the difference and potentially result in qualified data. **Table 4a, Relative Percent Difference (RPD) Calculations** provides the RPDs for sample and sample duplicates during the monitoring period. Seven RPD criteria failures were observed during the first 2023 semi-annual sampling event in parent duplicate pairs: (1) GS-AP-MW-17/GS-AP-MW-17 DUP for sulfate; (2-6) GS-AP-MW-34HO/GS-AP-34HO DUP for arsenic, barium, cobalt, lead, and molybdenum; and (7) GS-AP-MW-44HO/GS-AP-MW-44HO DUP for fluoride. In all instances of RPD criteria failure, the results reviewed were less than 5 times the RL. In these instances, a validation flag of (+) J, (ND)can be applied to the original samples.

Analytical data showed low-level or trace detections in field or equipment blanks during the monitoring period. All RPDs were below 20% for the second semi-annual sampling event.

Table 4b, Field QC: Blank Detections provides a summary of low-level detections observed during the first and second 2023 semi-annual monitoring events. With the exception of fluoride in sample FB-6 (March 2023 event), each of these detections was an estimated concentration, above the MDL but below the RL, and qualified in the laboratory analytical reports with "J flags." If concentrations are detected above the MDL in field QC samples, original results (1) on the date of a blank detection and (2) with a value less than 5 times the field QC detection are flagged with a (+) U* and the MDL/RL values are modified based upon the blank concentration. Validated flags do not have an impact on possible statistical analyses due to (1) low-level concentrations flagged during validation or (2) constituents flagged are not Site COI. The extent of trace chromium detections in blanks can be explained by a low MDL value of 0.000203 mg/L. During the first 2023 sampling event, four chromium detections and one fluoride detection were identified at low-level concentrations in five total field and equipment blanks from March 6, 2023 to March 28, 2023. During the second semi-annual sampling event, one chromium detection was identified at low level concentrations in one equipment blank collected on August 31, 2023.

5.2 STATISTICAL METHODOLOGY AND TESTS

Sanitas software is used to perform statistical analyses on Site data. Sanitas is a decision support software package that incorporates the statistical tests required of Subtitle C and D facilities by EPA regulations. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015) as well as with the USEPA Unified Guidance (2009).

5.2.1 Appendix III Evaluation

Interwell prediction limits, combined with a 1-of-2 verification strategy, are used to evaluate boron, calcium, chloride, fluoride, sulfate, and TDS. Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The most recent sample from each downgradient well is compared to the background limit to identify SSI.

Groundwater Stats Consulting demonstrated that these test methods were appropriate in the October 2017 Statistical Analysis Plan, which was updated in August 2020 with additional data screening and evaluation. Time series plots were used to screen proposed background data for suspected outliers, or extreme values that would result in limits that are not conservative from a regulatory perspective. Suspected outliers at all wells for Appendix III parameters are formally tested using Tukey's box plot method and, when identified, flagged in the computer database.

The following adjustments are also applicable to the statistical analysis per the Unified Guidance:

- No statistical analyses are required on wells and analytes containing 100% non-detects (EPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects in the background, simple substitution of one-half the reporting limit is used in the statistical analysis. The reporting limit used for non-detects is the practical quantitation limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects the Kaplan-Meier non-detect adjustment is applied to the background data.
- Non-parametric prediction limits are used on data containing greater than 50% non-detects.

5.2.2 Appendix IV Evaluation

When in corrective action, Appendix IV constituents are sampled semi-annually and concentrations are compared to GWPS. Following the Unified Guidance, spatial variation for Appendix III parameters is tested using the ANOVA; this test is not prescribed for Appendix IV constituents. Unlike the statistical evaluation of Appendix III constituents (where single-sample results are compared to the statistical limit), Appendix IV analysis uses the pooled results from each downgradient well to develop a well-specific Confidence Interval that is compared to the statistical limit. The statistical limit is either the interwell tolerance limit (i.e., background) calculated using the pool of all available upgradient well data (see Chapter 7 of the Unified Guidance), or an applicable groundwater protection standard such as the MCL. Appendix IV background data are screened for outliers and extreme trending patterns that would lead to artificially elevated statistical limits.

Parametric tolerance limits (UTL) were calculated using pooled upgradient well data for Appendix IV parameters with a target of 95% confidence and 95% coverage. The confidence and coverage levels for nonparametric tolerance limits are dependent on the number of background samples. The UTLs were then used as the GWPS.

As described in 40 CFR §§ 257.95(h)(1)-(3) and the ADEM Variance (see **Section 3.4.3)**, the GWPS is:

(1) The maximum contaminant level (MCL) established under 40 CFR §§ 141.62 and 141.66.
(2) Where an MCL has not been established:

(i) Cobalt 0.006 mg/L.
(ii) Lead 0.015 mg/L.
(iii) Lithium 0.040 mg/L.
(iv) Molybdenum 0.100 mg/L.

(3) Background levels for constituents where the background level is higher than the MCL or rule specified GWPS.

In corrective action, when the lower confidence limit (LCL), or the entire interval, exceeds the GWPS as discussed in the USEPA Unified Guidance (2009), the result is recorded as an SSL. GWPS for Appendix IV constituents are updated on a biennial schedule. This schedule was initiated in 2019 with updates occurring after the second semi-annual sampling event of each biennial year. Data from upgradient wells collected between updates may still be used to support ASDs (Alternate Source Demonstrations) if merited.

5.3 STATISTICAL EXCEEDANCES

Analytical data from the monitoring period were statistically analyzed in accordance with the Professional Engineer (PE)-certified Statistical Analysis Plan (October 2017) and updated in the August 2020 data screening evaluation performed by Groundwater Stats Consulting. Appendix III statistical analysis was performed to determine if constituents have returned to background levels. Appendix IV monitoring parameters were evaluated to determine if concentrations statistically exceeded the established groundwater protection standard.

5.3.1 Appendix III Constituents

Based on review of the Appendix III statistical analysis presented in **Appendix D, Statistical Analyses**, Appendix III constituents have not returned to background levels. A summary of Appendix III SSI is provided in the **Executive Summary Table** previously referenced.

5.3.2 Appendix IV Constituents

Table 5, Summary of Background Levels and Groundwater Protection Standards, summarizes the background limit established at each monitoring well and the GWPS. A summary table of the statistical limits accompanies the prediction limits in **Appendix D.** Site GWPS were updated after the Fall 2023 sampling event. The following subsections describe statistical exceedances during the first semi-annual monitoring event of 2023.

5.3.2.1 First Semi-Annual Groundwater Monitoring Event

During the first 2023 semi-annual monitoring event, statistical analysis of Appendix IV data incorporating limits defined in the 2019 ADEM Variance (section **3.4.3**) identified the following SSL over GWPS in the listed downgradient wells.

- GS-AP-MW-6D: Arsenic, Lithium.
- GS-AP-MW-7: Arsenic, Lithium, Molybdenum.
- GS-AP-MW-15: Lithium.
- GS-AP-MW-21: Lithium.

Due to insufficient background data, recently installed or converted downgradient wells were not included as part of the facility's statistical analysis during the first semi-annual event. Five recently converted downgradient wells demonstrating concentrations over the GWPS that were not statistically evaluated include the following:

- GS-AP-MW-3V: Lithium.
- GS-AP-MW-13R: Arsenic.
- GS-AP-MW-46: Arsenic.
- GS-AP-MW-15V: Lithium.
- GS-AP-MW-21V: Lithium.

As noted in the facility's Groundwater Monitoring Plan, a minimum of eight sampling events and a minimum of four sampling events must be completed prior to statistical analysis of Appendix III and Appendix IV constituents, respectively. **Table 6, First Semi-Annual Monitoring Event Analytical Results Summary**, provides a summary of all detected constituents for the first semi-annual sampling event. Statistical reporting output is included in **Appendix D**.

5.3.2.2 Delineation Wells – First Semi-Annual Groundwater Monitoring Event

Statistical analyses are not conducted on Site delineation wells. However, laboratory analytical data for the first semi-annual event identified concentrations above GWPS in the following delineation well locations:

- GS-AP-MW-6V: Fluoride, Lithium.
- GS-AP-MW-23H: Arsenic.
- GS-AP-MW-26H: Lithium.

- GS-AP-MW-27HR: Lithium.
- GS-AP-MW-34HO: Lithium.
- GS-AP-MW-41HD: Lithium.
- GS-AP-MW-42H: Arsenic.
- GS-AP-PZ-22: Lithium.

Table 6 provides a summary of all detected constituents for the first semi-annual sampling event. Statistical reporting output is included in **Appendix D.**

5.3.2.3 Second Semi-Annual Groundwater Monitoring Event

During the second 2023 semi-annual monitoring event, statistical analysis of Appendix IV data, incorporating limits defined in the 2019 ADEM Variance (section **3.4.3**), identified the following SSL over GWPS in the listed downgradient wells.

- GS-AP-MW-6D: Arsenic, Lithium.
- GS-AP-MW-7: Arsenic, Lithium, Molybdenum.
- GS-AP-MW-13R: Arsenic
- GS-AP-MW-15: Lithium.
- GS-AP-MW-46: Arsenic

Statistical analysis of Appendix IV concentrations over GWPS from monitoring wells GS-AP-MW-13R and GS-AP-MW-46 identified arsenic as an SSL for the first time during the second 2023 semi-annual sampling event. **Table 7, Second Semi-Annual Monitoring Event Analytical Results Summary**, provides a summary of all detected constituents for the second semi-annual sampling event. Statistical reporting output is included in **Appendix D.**

Due to insufficient background data, recently installed or converted downgradient wells were not included as part of the facility's statistical analysis during the second semi-annual event. Two recently converted downgradient wells demonstrating concentrations over the GWPS that were not statistically evaluated include the following:

- GS-AP-MW-3V: Lithium.
- GS-AP-MW-45V: Lithium

As noted in the facility's Groundwater Monitoring Plan, a minimum of eight sampling events and a minimum of four sampling events must be completed prior to statistical analysis of Appendix III and Appendix IV constituents, respectively.

5.3.2.4 Delineation Wells – Second Semi-Annual Groundwater Monitoring Event

Statistical analyses are not conducted on Site delineation wells. However, laboratory analytical data for the second semi-annual event identified concentrations above GWPS in the following delineation well locations:

- GS-AP-MW-6V: Fluoride, Lithium.
- GS-AP-PZ-22: Lithium.
- GS-AP-MW-23H: Arsenic.
- GS-AP-MW-26H: Lithium.
- GS-AP-MW-27HR: Lithium.
- GS-AP-MW-34HO: Lithium.
- GS-AP-MW-41HD: Lithium.
- GS-AP-MW-42H: Arsenic.

Fluoride, detected at concentrations above the GWPS in vertical delineation well GS-AP-MW-6V, is not being considered an impact from the Ash Pond and is not being evaluated for delineation based on the following lines of evidence:

(1) Absence of fluoride in pore-water samples (Ash Pond source water). Laboratory analytical results of the November 2023 sampling event revealed low-level detectable concentrations of fluoride (0.104 J mg/L). This low-level concentration of fluoride detected in the collected pore-water sample indicates that the ash pond is not a source for the high concentrations of fluoride detected in vertical delineation well GS-AP-MW-6V.

(2) No other compliance or delineation wells sampled contained elevated fluoride concentrations. Fluoride concentrations in other wells ranged from non-detect to 2.20 mg/L and average 0.265 mg/L.

(3) Fluoride concentrations in paired wells GS-AP-MW-6S and GS-AP-MW-6D were 0.122 and 0.153 mg/L respectively during the first 2023 semi-annual monitoring event.

(4) GS-AP-MW-6V is a relatively new and deeper screened well, which can introduce geochemical variability due to (1) localized variability or isolated source in the geologic formation or (2) a temporary disequilibrium caused by the installation of a new well.

Table 7 provides a summary of all detected constituents for the second semi-annual sampling event. Statistical reporting output is included as **Appendix D.**

6.0 ALTERNATE SOURCE DEMONSTRATION

An alternate source demonstration (ASD) was submitted in July 2021 and attached to the 2021 Annual Groundwater Monitoring and Corrective Action Report in January 2022. The alternate source demonstration focuses primarily on (1) the contribution of elevated pH to arsenic and lithium concentrations in wells GS-AP-MW-15/15V and GS-AP-MW-21 and (2) a comparison of Gorgas AP pore-water geochemistry to the geochemistry of downgradient wells. This ASD study and previous data documenting elevated trace metals in Warrior Basin (Pottsville) coal measures strata support a determination that many historical exceedances at the site are related to elevated pH or elevated trace metals in these coal measures.

The following summarizes key lines of evidence documented in the ASD and supporting alternative sources:

- Wells analyzed provided a ratio of lithium to boron different than pore-water samples (source).
- Wells analyzed provided a different geochemical fingerprint (geochemical facies) from pore-water samples.
- Substantial differences in the relative abundance of boron in comparison to chloride and lithium (i.e., conservative ions) in GS-AP-MW-15, GS-AP-MW-15V, and GS-AP-MW-21 compared to Ash Pond porewater indicate an alternate source for lithium.
- High sodium concentrations (+200 mg/L) and alkaline pH (> 10) of groundwater at GS-AP-MW-15, GS-AP-MW-15V, and GSAP-MW-21 relative to upgradient water and Ash Pond porewater indicate potential sodium-bentonite and grout contamination. Sodium-bentonite may allow for cation exchange with lithium.
- Lithium is naturally occurring and environmentally available in the bedrock at Plant Gorgas, as identified by chemical analysis and sequential extraction of rock samples.

As described in numerous previous reports, most notably the *September 2020 Progress and Groundwater Delineation Report*, detailed analyses of geochemistry data indicate that impacts to groundwater are concentrated north of the ash pond dam. Rock chemistry data as well as published technical reports provide sufficient documentation on sources of trace metals. Historical disturbances created by mining in and around Gorgas can also contribute to an increase in some constituents.

Historically, Plant Gorgas used coals from the Appalachian Basin (Warrior Basin included). Data included in Ruhl et al. (2014) indicate that ash derived from Appalachian Basin coals displays a $\delta^{11}B$ range of -2.7 to -17.6 ‰. In terms of natural occurring sources of boron, (1) groundwater typically displays a $\delta^{11}B$ range between 2 and 18 ‰ (2) precipitation a range between 7 and 23 ‰, and (3) soil and rocks between 0 and -5 %. Select wells were not analyzed due to historically low boron concentrations or absence of concentrations over the GWPS. A geogenic study investigating natural sources of COI at the Site has been initiated to follow up on the previously submitted ASD and subsequent geochemical evaluations that have highlighted a likely natural source.

7.0 GROUNDWATER ASSESSMENT AND CORRECTIVE ACTION

As required by Part E of the Order (AO 18-096-GW) and correspondence from the ADEM (March 2021), this report provides an update on groundwater delineation activities completed since the submittal of the Facility Plan for Groundwater Investigation (November 13, 2018). The primary purpose of this plan and subsequent phases of work was to identify the horizontal and vertical extent of groundwater impacts defined by EPA Appendix IV groundwater protection standards.

A comprehensive groundwater delineation report summarizing findings was submitted to ADEM in September 2020. The conclusions and results indicate groundwater delineation has been completed to a sufficient degree to define spatial extent of groundwater impacts and to inform a groundwater remedy selection plan.

7.1 CHRONOLOGY OF DELINEATION ACTIVITIES

Beginning in 2019, Semi-Annual Progress Reports had routinely been provided to ADEM in March and September. APC requested approval to combine information typically provided in the Semi-Annual Progress Reports with Semi-Annual Groundwater Monitoring and Corrective Action Reports on March 15, 2021. ADEM approved this approach and revised timeline for submittals on March 16, 2021. APC now provides ADEM with a discussion of delineation results and activities in each semi-annual groundwater monitoring and corrective action report until released in writing.

7.1.1 Delineation Wells

Part B of the Order required the installation of additional wells as necessary to define the extent of groundwater impacts. The following sections describe monitoring wells installed to delineate impacts to groundwater.

Phase I – Groundwater Investigation (January 2019 – August 2019)

Phase I was conducted between January 2, 2019, and August 15, 2019. **Table 1b** and **Figure 5** present details and locations of delineation wells. The following summarizes all activities completed during Phase I of groundwater delineation at the Site:

- Installed nine horizontal delineation wells (GS-AP-MW-23H, GS-AP-MW-24H, GS-AP-MW-25H, GS-AP-MW-26H, GS-AP-MW-27H, GS-AP-MW-28H, GS-AP-MW-29H, GS-AP-MW-

30H, and GS-AP-MW-30HS) and four vertical delineation (GS-AP-MW-7V, GS-AP-MW-12V, GS-AP-MW-17V, and GS-AP-MW-18V) wells between January 2, 2019 and February 26, 2019.

- Developed the delineation wells between January 11, 2019, and March 12, 2019. Horizontal delineation wells MW-25H, MW-27H, MW-30H, and MW-30HS and vertical delineation well MW-7V did not yield sufficient water to be developed or sampled and are used as water level only piezometers.
- Sampled the eight successfully developed delineation wells and three pre-existing Ash Pond piezometers between February 20, 2019, and March 19, 2019.
- Submitted a Semi-Annual Progress Report documenting groundwater investigation activities on March 30, 2019.
- Submitted a Groundwater Investigation Report to ADEM on May 13, 2019. This report recommended a second phase of groundwater investigation to complete delineation of groundwater impacts as required by Part B of the Order.
- Submitted an Assessment of Corrective Measures to ADEM on July 11, 2019, as required by Part C of the Order.
- Submitted a Phase II – Groundwater Delineation Plan to ADEM on August 15, 2019. This plan documented planned activities associated with proposed Phase II delineation efforts.

Phase II – Groundwater Investigation (September 2019 – March 2020)

Following a review of data gathered from the Phase I Investigation, additional groundwater investigation to further delineate the extent of groundwater impacts was proposed to ADEM in a Phase II Delineation Plan submitted August 15, 2019. Phase II was conducted between September 24, 2019, and March 27, 2020. **Table 1b** and **Figure 5** present details and locations of delineation wells and piezometers. The following summarizes all activities completed during Phase II of groundwater delineation at the Site:

- Completed semi-annual assessment sampling event in September 2019.
- Installed fifteen horizontal delineation wells (GS-AP-MW-25HA, GS-AP-MW-30HA, GS-AP-MW-31H, GS-AP-MW-32H, GS-AP-MW-33HO, GS-AP-MW-34HO, GS-AP-MW-35HO, GS-AP-MW-36H, GS-AP-MW-37H, GS-AP-MW-38H, GS-AP-MW-39H, GS-AP-MW-41HS, GS-AP-MW-41HD, GS-AP-MW-42H, and GS-AP-MW-43H), three vertical delineation wells (GS-AP-MW-9V, GS-AP-MW-15V, and GS-AP-MW-21V), and converted three existing deep piezometers (GS-AP-PZ-16, GS-AP-PZ-18, and GS-AP-PZ-22) to vertical delineation wells between September 24, 2019 and January 31, 2020.

- Submitted a Semi-Annual Progress Report documenting groundwater investigation activities on September 30, 2019.
- Developed the delineation wells between November 5, 2019, and January 30, 2020. Horizontal delineation wells GS-AP-MW-41HS, GS-AP-MW-37H, and GS-AP-MW-39H did not produce sufficient water to be developed or sampled and are used as water level only piezometers.
- Sampled the 15 successfully developed delineation wells and converted piezometers between March 16, 2020, and March 27, 2020.
- On December 30, 2019, provided ADEM with a response to comments received from ADEM on November 14, 2019.
- Surveyed developed wells in January 2020.
- Submitted a Semi-Annual Progress Report documenting groundwater investigation activities on March 30, 2020.

Phase III – Groundwater Investigation (April 2020 – September 2020)

Following a review of data gathered from the Phase I and II Investigations, additional groundwater investigation was conducted to address data gaps. **Table 1b** and **Figure 5** present details and locations of delineation wells. The following summarizes all activities completed during Phase III of groundwater delineation at the Site:

- Installed two vertical delineation wells north of the Ash Pond (GS-AP-MW-6V and GS-AP-MW-7VR), one horizontal delineation well west of the Ash Pond (GS-AP-MW-40H), and one off-site delineation well (GS-AP-MW-44H0) to the east of the Ash Pond. Onsite well installation activities took place between April 15, 2020, and May 1, 2020, and off-site installation between August 11, 2020 and August 16, 2020.
- Developed the delineation wells between May 27, 2020, and August 27, 2020. Vertical delineation well GS-AP-MW-7VR did not produce sufficient groundwater for well development.
- Sampled delineation wells in September 2020 along with all other delineation and compliance wells as part of the second semi-annual assessment monitoring event of 2020. Laboratory data was included in the 2020 Annual Groundwater Monitoring and Corrective Action Report.
- Conducted a study and re-analysis of low-yielding piezometers (GS-AP-MW-1, GS-AP-MW-3, GS-AP-MW-4, GS-AP-MW-7V, GS-AP-MW-16S, GS-AP-MW-20, GS-AP-MW-27H, GS-AP-MW-30H, GS-AP-MW-30HS, GS-AP-MW-37H, GS-AP-MW-39H, and GS-AP-MW-41HS) to assess potential for sampling and inclusion into monitoring well network. A summary memo and report were included in the 2020 Annual Groundwater Monitoring and Corrective Action Report.

- Submitted a Semi-Annual Progress and Groundwater Delineation Report documenting groundwater investigation activities on September 30, 2020.
- Responded to the February 3, 2021, ADEM Semi-Annual Progress and Groundwater Delineation Reports comments letter on March 5, 2021.
- Responded to the January 20, 2021, ADEM Groundwater Monitoring Plan comments letter and included a Supplemental Site Hydrogeologic Characterization Report on March 8, 2021.
- Submitted the second revised Groundwater Monitoring Plan to the ADEM on March 15, 2021.

Phase IV – Groundwater Investigation (June 2021 – July 2022)

Phase IV of delineation was focused on (1) addressing potential data gaps in lithium delineation and (2) evaluating alternative sources (naturally occurring or mine-related) of elevated lithium in wells where geologic and geochemical data already indicated the strong potential for an alternate source. Phase IV included the following scope:

- Re-attempting delineation wells GS-AP-MW-27H and GS-AP-MW-37H.
- Vertical delineation adjacent to well GS-AP-MW-23H.
- Vertical delineation adjacent to well GS-AP-MW-3 (converted to compliance location) and horizontal delineation east of well GS-AP-MW-3.
- Addressing general data gaps in the American coal flow system.
- Boron isotope sampling and analyses at selected well locations.
- Further geochemical study and evaluation of the occurrence of elevated lithium and arsenic.

During Phase IV 19 replacement, additional compliance, and delineation wells were installed and developed. Each of these will provide valuable information relevant to assessment. Replacement wells installed, surveyed, and developed include compliance replacement locations: GS-AP-MW-1R, GS-AP-MW-5R, GS-AP-MW-9R, GS-AP-MW-10R, GS-AP-MW-11R, GS-AP-MW-13R, GS-AP-MW-14R, GS-AP-MW-18R, and GS-AP-MW-18VR. Additional compliance wells were installed: GS-AP-MW-3V, GS-AP-MW-46, and GS-AP-MW-47. Information related to well construction details and screened lithology can be found in **Table 1a**. Additional or replacement delineation wells were installed during the Fall: GS-AP-MW-23V, GS-AP-MW-27HR, GS-AP-MW-37HR, and GS-AP-MW-PZ-18R. Information related to well construction details and screened lithology can be found in **Table 1b**. These wells were sampled for the first time during the February-March 2022 sampling event.

7.2 NATURE AND QUANTITY OF RELEASE

Part B of the Order required collecting data on the nature and estimated quantity of material released. To collect data regarding the nature of the source and estimated quantity of material released, sampling of ash pore-water at three locations was conducted. Ash pore-water was sampled for all EPA Appendix III and IV constituents. Groundwater quality data is compared to source water and leachate composition to provide a basis for evaluating the degree to which the source area has contributed constituents to groundwater.

7.3 DISCUSSION OF DELINEATION RESULTS

Analytical results identified concentrations above GWPS of EPA Appendix IV constituents arsenic, lithium, and molybdenum during the first and second semi-annual monitoring events of 2023. Isoconcentration maps for arsenic, lithium, and molybdenum are presented in **Figures 8A** through **13**. As shown on these figures, concentrations exceeding GWPS have been observed in three distinct flow systems: (1) Pratt Flow System, (2) American Flow System, and (3) Gillespy Flow System (north of dam).

The displayed isoconcentration lines are data-driven contours derived from the spatial distribution of constituent concentrations in the well network. When spatially distributed objects are spatially correlated (objects close to together have similar characteristics), interpolation analysis can be used to predict "unknowns" between objects. ArcGIS and Geostatistical Analyst are used to interpolate chemical concentrations between well locations. This process involves the transformation of chemical concentration data to log-normal distribution prior to interpolation. In cases where concentrations decrease below the GWPS between well pairs, the extent of groundwater impacts is interpreted from the interpolated (predicted) data set. This method considers the spatial pattern of decreasing concentrations observed in nearby wells. Additionally, when applicable, isoconcentration maps have been subdivided by major flow system (Pratt or American).

The location and spacing of delineation wells are based on the following goals and site factors:

1. Determine if impacts to groundwater could extend off-site in the direction of groundwater flow away from the facility.
2. Evaluate potential for vertical migration adjacent to compliance wells with SSL and within the context of site hydrogeology.
3. Address key data gaps between phases, working in from property line or off-site depending on gaps.
4. Ability to safely access locations with drill rig and supporting equipment.

5. Occurrence of groundwater and sufficient groundwater yield and recharge at locations.
6. Delineate extent of impacts and capture additional hydrogeologic data necessary to evaluate the feasibility of groundwater remediation technologies.

Table 1b provides a complete list of delineation wells.

Arsenic Delineation

Figures 8A and **8B**, and **11A** and **11B,** show the extent of arsenic concentrations over the 0.01 mg/L GWPS observed during the first and second 2023 semi-annual events, respectively. During the first and second semi-annual sampling events, arsenic exceedances were limited to the Pratt Flow System and Gillespy Flow System. As shown on **Figures 8B** and **11B**, arsenic concentrations in the American Flow System were below the GWPS.

Monitoring locations GS-AP-MW-15, GS-AP-MW-15V, and GS-AP-MW-21V have exhibited downward trends since the 2020 sampling events, and each of these locations exhibited concentrations below the GWPS for arsenic during the first and second 2023 semi-annual sampling events. In addition, compliance monitoring well GS-AP-MW-6S has been below the GWPS for arsenic six out of the previous eight sampling events beginning in 2020. Prior to 2020, arsenic had exceeded the GWPS 9 out of 13 sampling events.

Two recently installed downgradient wells, GS-AP-MW-13R and GS-AP-MW-46, demonstrated arsenic concentrations above the GWPS (**Figures 8A** and **11A).** These are the fourth sampling results from the two well locations and concentrations (1) may reflect temporary disequilibrium caused by the well installation process and (2) have not been delineated due to the preliminary nature of sampling results. It is recommended that an additional three or four sampling events be conducted prior to discussing these specific arsenic concentrations as exceedances attributable to the ash pond and in the context of delineation.

In the northern area of the Site, arsenic was detected at concentrations that exceed its respective GWPS in wells GS-AP-MW-6D, GS-AP-MW-7, GS-AP-MW-23H, and GS-AP-MW-42H during the first and second semi-annual sampling events. In addition, elevated concentrations of arsenic that exceed its GWPS were observed in wells GS-AP-MW-13R and GS-AP-MW-6S during the first and second semi-annual sampling events, respectively. Compliance wells GS-AP-MW-6D and GS-AP-MW-7 are screened across or next to the Gillespy coal or equivalent horizon (when absent) and arsenic is horizontally delineated in the same horizon by delineation wells GS-AP-MW-25HA and GS-AP-MW-41HD.

Vertically, arsenic is delineated by well locations GS-AP-MW-6S, GS-AP-MW-6V, GS-AP-MW-23V and the absence of groundwater flow beneath the GS-AP-MW-7 screened interval (no yield zones encountered in delineation wells attempted at GS-AP-MW-7V and GS-AP-MW-7VR). Arsenic in well GS-AP-MW-6S has been below the GWPS during six of the last eight sampling events. Unless a significant trend reversal occurs, this location is suitable for the uppermost vertical delineation of arsenic. The stratigraphy in this area is detailed in **Figure 4F**.

Additional assessment is required to determine the source of arsenic in horizontal delineation well GS-AP-MW-23H. The following lines of evidence suggest the possibility of a source other than the ash pond:

(1) Screened interval is located above the base of CCR material and approximately 50 feet higher than Gillespy or equivalent monitored by GS-AP-MW-6D, GS-AP-MW-7, and GS-AP-MW-41HS/HD.
(2) Physical location of well appears separated from preferential flow (upslope of valley) and groundwater elevations appearing separate from other wells upgradient of GS-AP-MW-23H.
(3) Low boron concentrations and poor correlation coefficient with boron concentrations.
(4) Low lithium concentrations.
(5) $\delta^{11}B$ value of 3.2 to 4.2 ‰, which indicates strongest potential for a natural or meteoric source of boron.
(6) Iron concentrations between 46 and 54 mg/L, which are 5 times higher than the next highest well (GS-AP-MW-26H) and much greater than the site average that otherwise ranges from 0.84 to 1.82 mg/L from 2019 to 2023.
(7) Low pH range, generally between 5.8 and 6.3, which is much lower than the site average of 7.68 to 8.06 SU observed from 2019 to 2023.

In summary, arsenic exceedances to the north have been successfully delineated within the Gillespy Flow system. Analytical data from future sampling events will be reviewed to determine the need for additional delineation or an alternate source demonstration study to address arsenic at locations GS-AP-MW-13R and GS-AP-MW-46.

Lithium Delineation

Lithium exceedances were observed in the American Flow System, Pratt Flow System, and Gillespy Flow System during the first and second 2023 semi-annual monitoring event.

Lithium Delineation - Gillespy Flow System

Figures 9A and **12A** show the extent of potential lithium impacts within the Pratt and Gillespy flow systems (**Figures 9B** and **12B** show Gillespy/Pratt Transition - north of dam only) during the first and second 2023 semi-annual groundwater monitoring events. North of the dam and in the Gillespy Flow System, lithium concentrations over the GWPS are noted in wells GS-AP-MW-6D, GS-AP-MW-6V, GS-AP-MW-7, and GS-AP-MW-41HD (March event only). North of the dam, lithium concentrations are delineated to below GWPS concentrations in the direction of groundwater flow by wells GS-AP-MW-23H, GS-AP-MW-23V, GS-AP-MW-24H, and GS-AP-MW-42H (**Figure 9B and 12B**).

As described in the *September 2020 Progress and Groundwater Delineation Report*, no deeper flow zones were observed beneath the screened intervals of GS-AP-MW-7, GS-AP-MW-41HD, and GS-AP-MW-6V. Boring, geophysical, hydrophysical, and "dry" piezometer data indicate that flow to the north is accommodated by two or three discrete fracture/bedding planes in the Gillespy Coal Group and Pratt-Gillespy Coal transition zone, thus indicating that there is little to no groundwater yield beneath the discrete planes. Concentrations lower than GWPS in groundwater yielding zones above these discrete zones also correlate with preferential flow conditions.

Additional delineation locations are not feasible or are severely limited due to topography, saturated conditions, ash pond closure activities, and utilities. Sufficient delineation and site hydrogeologic data have been studied to understand suitable remedial technologies in these areas. A permeation grouting pilot program is being evaluated for application across the discrete flow zones.

As shown on **Figures 9A**, **9B**, **12A**, and **12B,** the highest concentrations of lithium correlate to areas previously mined (dashed lines showing Pratt Strip Mines), thus contributing to the elevated lithium concentrations north of the dam**.**

As boron and lithium behave similarly in groundwater (largely unreactive), boron isotopic results can provide an indication of the source of lithium. Boron isotopes have been studied and implemented as tracers for CCR impacts to groundwater (Davidson and Bassett, 1993; Ruhl et al., 2014). These studies have shown that coal or CCR sources are definitively identified by a distinctive negative $\delta^{11}B$ signature, while other geologic and anthropogenic sources display positive ratios. Historically, Plant Gorgas has used coal from the Appalachian Basin (Warrior Basin included). Data included in Ruhl et al. (2014) indicate that ash derived from Appalachian Basin coals display a $\delta^{11}B$ range of -2.7 to -17.6 ‰. In terms of natural occurring sources of boron, (1) groundwater typically displays a $\delta^{11}B$ range between 2 and 18 ‰, (2) precipitation between 7 and 23 ‰, and (3) soil and rocks between 0 and -5 ‰.

In wells GS-AP-MW-6S and GS-AP-MW-7, boron isotopic results indicate lithium concentrations are sourced from coal or CCR. Conversely, corroboration of potential mine or natural sources of lithium is indicated by boron isotope data from wells GS-AP-MW-6V and GS-AP-MW-41HS, which show $\delta^{11}B$ values of 13.3 ‰ and 3.6-5.0 ‰, respectively. These values strongly indicate a source other than the ash pond. Boron isotope data are summarized below.

Well	$\delta^{11}B$ (‰)	Boron Source
GS-AP-MW-6S	-6.2	Coal or CCR
GS-AP-MW-6D	-1.7	Mudstone/Shale
GS-AP-MW-6V	13.3	Meteoric
GS-AP-MW-7	-12.8	Coal or CCR
GS-AP-MW-23H	4.2	Meteoric
GS-AP-MW-41HS	3.6-5.0	Meteoric

In summary, boron isotopic analyses strongly suggest that pond-derived impacts are restricted to wells GS-AP-MW-6S, GS-AP-MW-7, and potentially well GS-AP-MW-6D. Additional study on the potential geogenic origins of lithium associated with the Site was initiated in the spring of 2023 to assess the extent of lithium impacts.

Lithium Delineation - Pratt Flow System

Figures 9A and **12A** illustrate lithium exceedances observed in the Pratt Flow System where wells GS-AP-MW-15 and GS-AP-MW-21 show concentrations above the GWPS during the first and second 2023 sampling events. The ASD described in **Section 6.0** addresses exceedances in wells GS-AP-MW-15 and GS-AP-MW-21 as unrelated to the ash pond. In addition to the analyses described in **Section 6.0** and the ASD submitted in July 2021, boron isotope analyses were attempted at these two well locations. The results were below the quantifiable limit.

In the areas with potential lithium impacts, horizontal delineation to below GWPS concentration can largely be derived from nearby wells: GS-AP-MW-46, GS-AP-MW-31H, GS-AP-MW-18VR, GS-AP-MW-33HO, GS-AP-MW-17, GS-AP-MW-28H, and GS-AP-MW-36H. Southeast of GS-AP-MW-21, piezometers GS-AP-MW-30H and GS-AP-MW-20 show insufficient groundwater yield in Pratt intervals. However, the deeper American Flow System was productive and can be used in the assessment of lithium concentrations.

In terms of vertical delineation, during first 2023 semi-annual monitoring event, lithium was below the GWPS in well GS-AP-MW-15V (installed in deeper American Flow System), and above the GWPS during the second semi-annual event. Lithium concentrations in well GS-AP-MW-15V have decreased from a concentration of 0.208 mg/L when first sampled in March 2020 to 0.0849 mg/L during the most recent sampling event in September 2023. Additionally, lithium concentrations have been below GWPS in two of the four most recent sampling events in February 2022 and March 2023 respectively. Decreasing lithium concentrations in well GS-AP-MW-15V correspond to decreasing pH concentrations of 10.89 when first sampled in March 2020 to 7.89 during the most recent sampling event in September 2023.

In addition, elevated concentrations of lithium were detected in compliance well GS-AP-MW-21V, also installed in the deeper American Flow System (**Figures 9C** and **12C**) during the first and second semi-annual events. Both GS-AP-MW-15V and GS-AP-MW-21V have exhibited a decreasing trend and significantly reduced concentrations from initial sampling events.

Lithium Delineation - American Flow System

Figures 9C and **12C** depict the spatial extent of potential lithium impacts within the American coal flow system during the first and second 2023 semi-annual groundwater monitoring events. Concentrations observed over the GWPS are noted for wells GS-AP-MW-26H, GS-AP-MW-21V, GS-AP-PZ-22, GS-AP-MW-3V, and GS-AP-MW-34HO.

Western Areas

The elevated concentration of lithium detected in delineation well GS-AP-MW-26H appears to be (1) elevated naturally occurring lithium or (2) elevated lithium due to an alternate source. Supporting evidence includes:

1) Absence of lithium exceedances at waste boundary compliance wells upgradient of GS-AP-MW-29H (in both Pratt and American coal screened wells).
2) Increasing lithium concentration trend with distance away from the ash pond.
3) Lack of other CCR indicator parameters:
    a. Boron – 87.5% non-detect, highest concentration is a low-level, estimated (j-flagged) concentration (0.0334 mg/L (J)).
    b. Molybdenum – 87.5% non-detect or low-level, estimated concentrations.
    c. Arsenic – 87.5% non-detect or low-level, estimated concentrations.
4) Well location adjacent to Jacobs Mine permit boundary.
5) Concentration below highest concentration of proposed upgradient well GS-AP-MW-16S indicating lithium in normal concentration range for site.

For these reasons, no further delineation activities are planned near GS-AP-MW-26H for purposes of further delineating lithium. Furthermore, horizontal delineation would technically be achieved in this area by the below-GWPS concentrations observed in GS-AP-MW-40H to the west and GS-AP-MW-38H to the south.

Southern Areas/Maxine Mine

Figures 9C and **12 C** show, to the south, lithium exceedances observed in American coal or Maxine mine screened locations GS-AP-MW-21V, GS-AP-PZ-22, and GS-AP-MW-34HO during the first and second 2023 semi-annual groundwater monitoring events.

As presented on these figures, the southern area of the site (south of line from GS-AP-MW-15V to GS-AP-MW-21V) was previously disturbed by the underground Maxine American Seam Mine. The relatively large size and location of this mine prevents the installation of groundwater wells that are truly representative of the American coal flow system.

As previously described, lithium concentrations in well GS-AP-MW-15V are influenced by pH conditions that have ranged between 7.64 and 10.89 standard units (SU). Data also show that pH conditions have been steadily decreasing since the initial sampling event in March 2020, with values at their lowest during the most recent sampling event (7.64 SU). Lithium concentrations have similarly decreased, most notably since the initial three sampling events. Data evaluation suggests the groundwater geochemistry was likely impacted by the well installation and construction process. Geochemical data suggest that since installation and the initial sampling event, geochemical equilibrium is slowly being restored to more normal conditions. Furthermore, low-level and stable concentrations of boron suggest a source other than CCR leachate.

For well GS-AP-MW-15V, analytical data sets are beginning to show concentrations and values similar to historical averages for the American flow system beneath the Site. When pH conditions are confirmed to have stabilized, it will be most appropriate to evaluate lithium concentrations as representative and for potential groundwater impacts. At a minimum, data collected prior to 2022 appears unrepresentative of Site groundwater quality.

To the southwest, well locations GS-AP-MW-36V, GS-AP-PZ-16, and GS-AP-PZ-22 can be used to effectively demonstrate horizontal delineation in the American coal and Maxine Mine. Maxine Mine location GS-AP-PZ-16 was below the lithium GWPS during the first and second semi-annual sampling events.

However, due south, horizontal delineation well GS-AP-MW-34HO exceeds the GWPS for lithium but appears to present a case as a potential outlier. As shown on **Figure 9C** and **12C**, the lithium concentration observed is two or more times higher than that observed in wells closer to the waste boundary. The evidence supporting the presence of an alternate source includes the following:

1) Increasing lithium concentration trend with distance away from the ash pond.
2) Low concentrations of other CCR indicator parameters:
    a. Boron – 0.0827 (J) to 0.109 [mg/L]
    b. Molybdenum – 0.00386 (J) to 0.0143 (J) [mg/L]
    c. Arsenic – 0.00308 (J) to 0.00668 [mg/L]
3) Chloride concentrations significantly greater than CCR pore-water.
4) Geochemical facies representative of ancient groundwater (sodium-chloride) and different than CCR pore-water (calcium-chloride).
5) Boron isotopic fractionation not representative of CCR signature, where a $\delta^{11}B$ value of 13.8 to 15.7 ‰ suggests a meteoric signature of boron, and thus, lithium.
6) Well location surrounded by the large-scale, underground Maxine Mine.

For these reasons, no further delineation activities for lithium constituents are planned near well GS-AP-MW-34HO.

Lithium concentrations in well GS-AP-MW-21V have decreased from a concentration of 0.146 mg/L when first sampled in March 2020 to below GWPS (0.0789 mg/L) in August 2022. However, lithium concentrations increased to above GWPS during the 2023 sampling events (0.11 mg/L March 2023 and 0.0928 mg/L September 2023). Additional delineation efforts in the area surrounding downgradient well MW-21V may be warranted, pending ADEM's review of the July 2021 ASD. Lithium concentrations detected in downgradient well MW-21V will continue to be closely monitored.

Northern Areas

As shown in **Figures 9C** and **12C**, lithium concentrations were generally below the GWPS during the first and second 2023 semi-annual groundwater monitoring events, with the exception of well GS-AP-MW-3V located to the northeast. Downgradient compliance wells GS-AP-MW-5R and GS-AP-MW-3V were recently installed in the Fall of 2021 and have since been sampled a total of four times. Preliminary laboratory analytical data indicate an upwards trend of detected lithium concentrations in compliance wells GS-AP-MW-5R and GS-AP-MW-3V. In accordance with the facility's Groundwater Monitoring Plan, detected concentrations of Appendix IV constituents in downgradient wells GS-AP-MW-5R and GS-AP-

MW-3V were incorporated into the facility's statistical analysis. However, until sufficient background has been established, Appendix III constituents detected in compliance wells GS-AP-MW-5R and GS-AP-MW-3V will not be incorporated into the facility's statistical analysis. Additional sampling and laboratory analysis is required to ensure that the detected lithium concentrations are representative of the Site's groundwater quality. Once sufficient background has been established, the need for additional assessment in the area surrounding GS-AP-MW-5R and GS-AP-MW-3V will be evaluated.

Molybdenum Delineation

Figures 10 and **13** show the extent of potential molybdenum impacts to groundwater observed during the first and second 2023 semi-annual sampling events. The molybdenum concentrations detected in downgradient compliance well GS-AP-MW-7, located north of the ash pond dam, exceeded its respective GWPS during the first and second 2023 semi-annual events. Historical molybdenum concentrations detected in delineation wells GS-AP-MW-23H, GS-AP-MW-24H, GS-AP-MW-41HD, and GS-AP-MW-42H indicate that the extent of molybdenum has been horizontally delineated. To assess for the vertical extent of molybdenum impact in the areas surrounding GS-AP-MW-7, two vertical delineation wells identified as GS-AP-MW-7V and GS-AP-MW-7VR were installed in 2019 and 2020, respectively. However, these two delineation wells did not produce sufficient groundwater for well development or low-flow sampling methods and were subsequently redesignated as piezometers.

Borehole geophysical logs for piezometers MW-7V and MW-7VR and compliance well GS-AP-MW-7 (chiefly fluid resistivity and fluid temperature logs) did not provide robust evidence of groundwater flow zones deeper than 88 feet BGS where GS-AP-MW-7 already monitors. The fracture encountered at GS-AP-MW-7 and noted in geophysical logs for MW-7V and MW-7VR appears to be the basal and most prominent flow feature in the area. Therefore, no additional vertical delineation is proposed within the vicinity of GS-AP-MW-7.

7.4 STATUS OF DELINEATION

As described in **Section 7.1.1**, a fourth phase of work and study was conducted. Nineteen wells were installed to address potential data gaps. All additionally installed and existing wells were sampled for the first time during the spring of 2022. A review of recent data identified the potential data gaps, listed below. Because gaps are primarily associated with the most recently installed wells, or wells where significant signatures of natural or alternate sources are present in the data, the recommended plan of action is to:

(1) Evaluate the occurrence, distribution, and mobility of naturally occurring lithium in subsurface geologic materials (generally using recent Gorgas Gypsum Pond study as template).
(2) Allow for the collection of four to six additional groundwater samples in recently installed wells prior to evaluation.
(3) After review of the above tasks and result, evaluate the need for potential additional delineation and assessment. Potential needs are outlined below.

Lithium Delineation

- Pratt Flow System
  - **Horizontal delineation (or new compliance well), re-attempt: east and/or southeast of GS-AP-MW-21.***
  - **Horizontal delineation southwest/west of GS-AP-MW-15 and GS-AP-MW-27HR.***
- American Flow System
  - Horizontal delineation or new compliance well to the southeast (between GS-MW-30HA and GS-AP-MW-34HO).

Arsenic Delineation

- Pratt Flow System
  - Potential Future Action: (1) Horizontal delineation west-southwest of GS-AP-MW-13R and offset vertical delineation, (2) Horizontal delineation east of GS-AP-MW-46 and offset vertical delineation, and (3) Horizontal delineation west of GS-AP-MW-7. These are labeled potential future actions pending the recommendation to re-evaluate data and trends after six to eight sampling events. Rationale for this recommendation is provided in the Arsenic Delineation portion of **Section 7.3**.

* The bolded text in the list above indicates an ASD has been presented to address these exceedances and selected data gaps. A review of the data revealed no data gaps associated with molybdenum impacts due to the confined exceedances that are limited to only one well location.

7.5 GROUNDWATER REMEDY AND CORRECTIVE ACTION

An Assessment of Corrective Measures (ACM) for groundwater impacts was conducted and formally submitted to ADEM in June 2019. Additional data analyses and investigations conducted since the ACM culminated with a detailed Groundwater Remedy Selection Report, submitted in December 2021, and a Corrective Action Groundwater Monitoring Program submitted in March 2022.

Submittal	Submittal Date	Purpose
Assessment of Corrective Measures	06/2019	Initial evaluation of the feasibility, performance, and implementation of known and emerging groundwater remediation technologies against site conditions and factors.
Groundwater Remedy Selection Report	12/2021	Formal selection and detailed description of groundwater remedies selected for implementation at the site.
Corrective Action Groundwater Monitoring Program	03/2022	Plan document to describe process and program for implementation and monitoring of groundwater remedies selected at the site.

7.5.1 Groundwater Remedy Selection

As described in **Section 5** and **Section 7.3**, geochemical data gathered and analyzed indicate that groundwater impacts may be constrained in a small area north of the dam and between wells GS-AP-MW-6S, GS-AP-MW-7, and GS-AP-MW-41HD. A small footprint of impacted groundwater flowing through well-defined, discrete bedding provides an opportunity for a targeted groundwater remediation program. The Groundwater Remedy Selection Report described the selected remedies for groundwater corrective actions at the site:

- Source control to include dewatering, consolidation, and capping of the CCR unit.
- Permeation grouting in areas of higher concentrations of constituents of interest (COI) or preferential groundwater flow pathways to prevent COI movement.
- Monitored natural attenuation (MNA) over the entire site.

Additionally, it was determined that geochemical manipulation should be included as an alternate or companion remedy selection with permeation grouting. Geochemical manipulation using injection removes COI from groundwater and immobilizes them in situ through the creation of solid precipitates formed from injection of treatment solutions. A Laboratory Treatability Study Results report for the Plant Gorgas Ash Pond is included as **Appendix E**.

Closure of the CCR Unit, including dewatering, consolidation, and capping, will greatly reduce or eliminate source contributions to groundwater. Permeation grouting was selected because, as a corollary to barrier walls, it impedes groundwater flow and helps prevent the migration of COI away from the source area. Geochemical manipulation was selected as an additional potential corrective measure because of its effectiveness, ease of implementation, versatility (ability to treat more than one COI), ability to implement in areas with limited working space, and because it produces no byproducts that would require further treatment or disposal. Permeation grouting can be viewed as a complementary method to MNA, where either the sealing of groundwater flow or the slowing of the flow path away from the source area provides longer residence time for MNA processes or geochemically enhanced MNA processes to reduce COI concentrations. MNA was selected based on the evidence gathered during initial investigations, which highlighted that these processes are already occurring.

7.5.2 Corrective Action – Groundwater Monitoring Program

The Corrective Action Groundwater Monitoring Program describes early plans for implementation and monitoring of groundwater remedies described above. This plan divided the program into two stages.

- Stage 1 will include ongoing compliance monitoring, remedial effectiveness monitoring for permeation grouting, MNA performance monitoring, sentinel and clean-line monitoring (including surface water monitoring), and demonstration that Site conditions remain protective of potential human and ecological receptors. Prompt action will be taken should data or data trends indicate such actions are warranted.

- Stage 2 monitoring will be implemented upon Site closure, with the first 2 years of Stage 2 monitoring consisting of background data collection to serve as a baseline. Stage 2 monitoring will consist of ongoing compliance monitoring, additional wells or sampling locations as needed to evaluate remedy effectiveness, additional MNA parameters as needed, mass and mass flux calculations, additional monitoring associated with permeation grouting (if implemented), re-evaluation of natural attenuation processes and efficacy every 10 years, and demonstration that Site conditions remain protective of potential human and ecological receptors.

Stage 1

The initial phase of Stage 1 has implementation tasks associated with each selected groundwater remedy that serve as a foundation for the remainder of Stage 1 and Stage 2:

Selected Remedy	Implementation Task(s)
Monitored Natural Attenuation	1. Implementation of expanded MNA sampling parameters. 2. Further assessment of MNA monitoring network.
Permeation Grouting/Geochemical Injection Program	1. Plan, Work Scope development and field program for the detailed characterization of fracture flow characteristics and data needs. supporting a permeation grouting pilot. 2. Implementation of Permeation Grouting and/or Geochemical Injection Pilot Program using data collected from detailed characterization.
Source Control/Closure Activities	1. Evaluation of geochemical changes in groundwater with respect to transient closure activities such as excavation and de-watering. 2. Implementation of field data collection instruments/telemetry within key monitoring wells to further understand the nature of geochemical changes over time and with respect to closure activities and MNA/geochemical modelling.

Implementation of Monitored Natural Attenuation

MNA sampling parameters were added to the sampling plans and analyzed in the laboratory during the February-March 2022 sampling event and have continued through the most recent 2023 semi-annual events (**Table 6** and **7**). These parameters, in addition to field parameters, Appendix III parameters, and Appendix IV parameters, are used to study the processes that govern or facilitate MNA as well as changes in geochemical conditions. Parameters will be included in the site geochemical model.

Source Control and Closure Activities

The primary tasks and objectives at the start of Stage 1 include: (1) monitoring and reviewing for changes in geochemical conditions that would invoke an adaptive trigger, (2) studying transient changes in groundwater quality that could be the result of physical closure activities, and (3) determining primary mechanisms and geochemical relationships related to changing geochemical conditions. The understanding of mechanisms and relationships leading to geochemical changes in groundwater provides opportunity to further understand natural MNA processes at the site and document the benefits and impacts of source control as closure progresses.

As a part of the Semi-Annual Monitoring Reporting process, groundwater quality is being evaluated with respect to:

1) Concentration Trends:
    a) By analyte.
    b) By locations.
    c) In aggregate.
2) Geochemical correlations.
    Concentration trends and geochemical correlations cross-referenced by recent or active ash pond closure activities.

To facilitate further understanding of trends and correlating relationships, installation of groundwater quality instrumentation is planned at select key monitoring well locations for the near continuous monitoring of field parameters. This additional data will allow for a better understanding of the degree of changes driven by different types of closure and construction activities, the response of site flow systems, and possible correlations and changes noted in semi-annual monitoring data.

Permeation Grouting and/or Geochemical Injection Program

An Implementation and Data Requirements Pre-Design Investigation (PDI) Plan for a permeation grouting and/or geochemical injection pilot study program is being drafted to outline the means and methods for the complete geologic and hydrogeologic characterization of areas of the Site selected for a pilot study. The program includes a pre-design investigation work plan for the detailed characterization of fracture flow through the Pottsville Formation, including standards for core logging, downhole geophysical methods, hydrogeophysical methods, and aquifer performance testing. This work plan will be executed in the field and the data analyzed to complete the initial study (foundation phase) of the Permeation Grouting Pilot Program.

7.5.3 Pre-Design Investigation

The objective of the PDI is to provide data specific to the potential remediation areas (PRA) to enable predictive groundwater modeling and to inform the design of a permeation grouting/geochemical injection pilot test. The specific PRA of interest for the PDI is still undetermined but will likely include the locations of either GS-AP-MW-15, GS-AP-MW-21, or GS-AP-MW-6D/GN-AP-MW-7. The determination of the PRA of interest will be based in part on results of a surface geophysics survey (electrical resistivity imaging (ERI) and the self-potential (SP) method) that is scheduled to be performed in February 2024. Additionally, the investigation will further define the understanding of certain subsurface lithologic/hydrogeologic data to include:

- Bedrock fracture data
  - Fracture orientations
  - Fracture apertures and spacings
- Hydraulic data
  - Bulk hydraulic conductivity
  - Hydraulic responses between wells
- Groundwater transport continuity between wells
  - Proof of flow path continuity between and among wells
- Aquifer characteristics
  - Mineralogy and geochemical properties of fracture surfaces
  - Mineralogy and geochemical and physical properties of unfractured rock matrix
- Groundwater characteristics
  - Constituent of interest (COI) concentrations
  - Groundwater geochemical properties

The overall scope of work (SOW) developed for this PDI proposed the following tasks:

- Update the hydrogeologic conceptual site model (HCSM).

- Perform a surface geophysical survey consisting of ERI and SP methods for identifying the most appropriate location for advancing borings.
- Monitor groundwater elevations.
- Advance an estimated two exploratory boreholes (with additional borings to be performed, if appropriate).
- Collect detailed borehole data, including the following:
  - Core descriptions and sample collection.
  - Packer testing (hydraulic testing and groundwater sampling via extraction of groundwater from packer-isolated bedrock intervals).
  - Downhole geophysical logging, to include conventional tools and potentially, an optical/acoustic borehole televiewer, a heat pulse flowmeter (HPFM), cross-borehole resistivity, and nuclear magnetic resonance (NMR; only in existing monitoring wells).
  - Lugeon hydraulic conductivity testing.
- Determine and implement disposition of each borehole – for example, monitoring well, tracer injection/extraction well, or temporary securement of open borehole at ground surface to allow for future decisions on permanent borehole disposition.
- Evaluate the need for tracer testing and implement as warranted.
- Evaluate the need for permeation grout test borings and implement as warranted.
- Evaluate the need for geochemical injection/manipulation test borings and implement as warranted.

8.0 SUMMARY AND CONCLUSIONS

Semi-annual groundwater monitoring events were conducted in March 2023 and August and September 2023. Statistical evaluations of the monitoring data identified SSL of Appendix IV constituents above the GWPS. To address previously identified SSL, a Groundwater Remedy Selection Report was prepared and submitted to ADEM on December 17, 2021. Subsequently, within 90 days of remedy selection, a Corrective Action Groundwater Monitoring Program was developed and submitted to ADEM on March 15, 2022.

The Corrective Action Groundwater Monitoring Program was prepared to detect potential downgradient changes in groundwater quality and assess the efficacy of the selected groundwater corrective action remedies. The Monitoring Program will supplement the ongoing CCR compliance groundwater monitoring currently being performed at the Site.

The following future actions will be taken or are recommended for the Site:

- Continue with implementation and evaluation of the PDI work plan as part of the Permeation Grouting Pilot Program for the remediation of arsenic, lithium, and molybdenum related to corrective action measures at the Site.
- Continue ongoing research to evaluate the applicability of the in situ groundwater treatment and to assess technical and implementation feasibility of geochemical manipulation and enhanced MNA technologies.
- Following complete evaluation of Site data collected during the PDI, a report summarizing the findings and recommended future remedial techniques for the Site will be prepared.
- Conduct the first semi-annual monitoring event in the spring of 2024 and submit the Semi-Annual Groundwater Monitoring and Corrective Action Report summarizing the findings to ADEM by July 31, 2024.

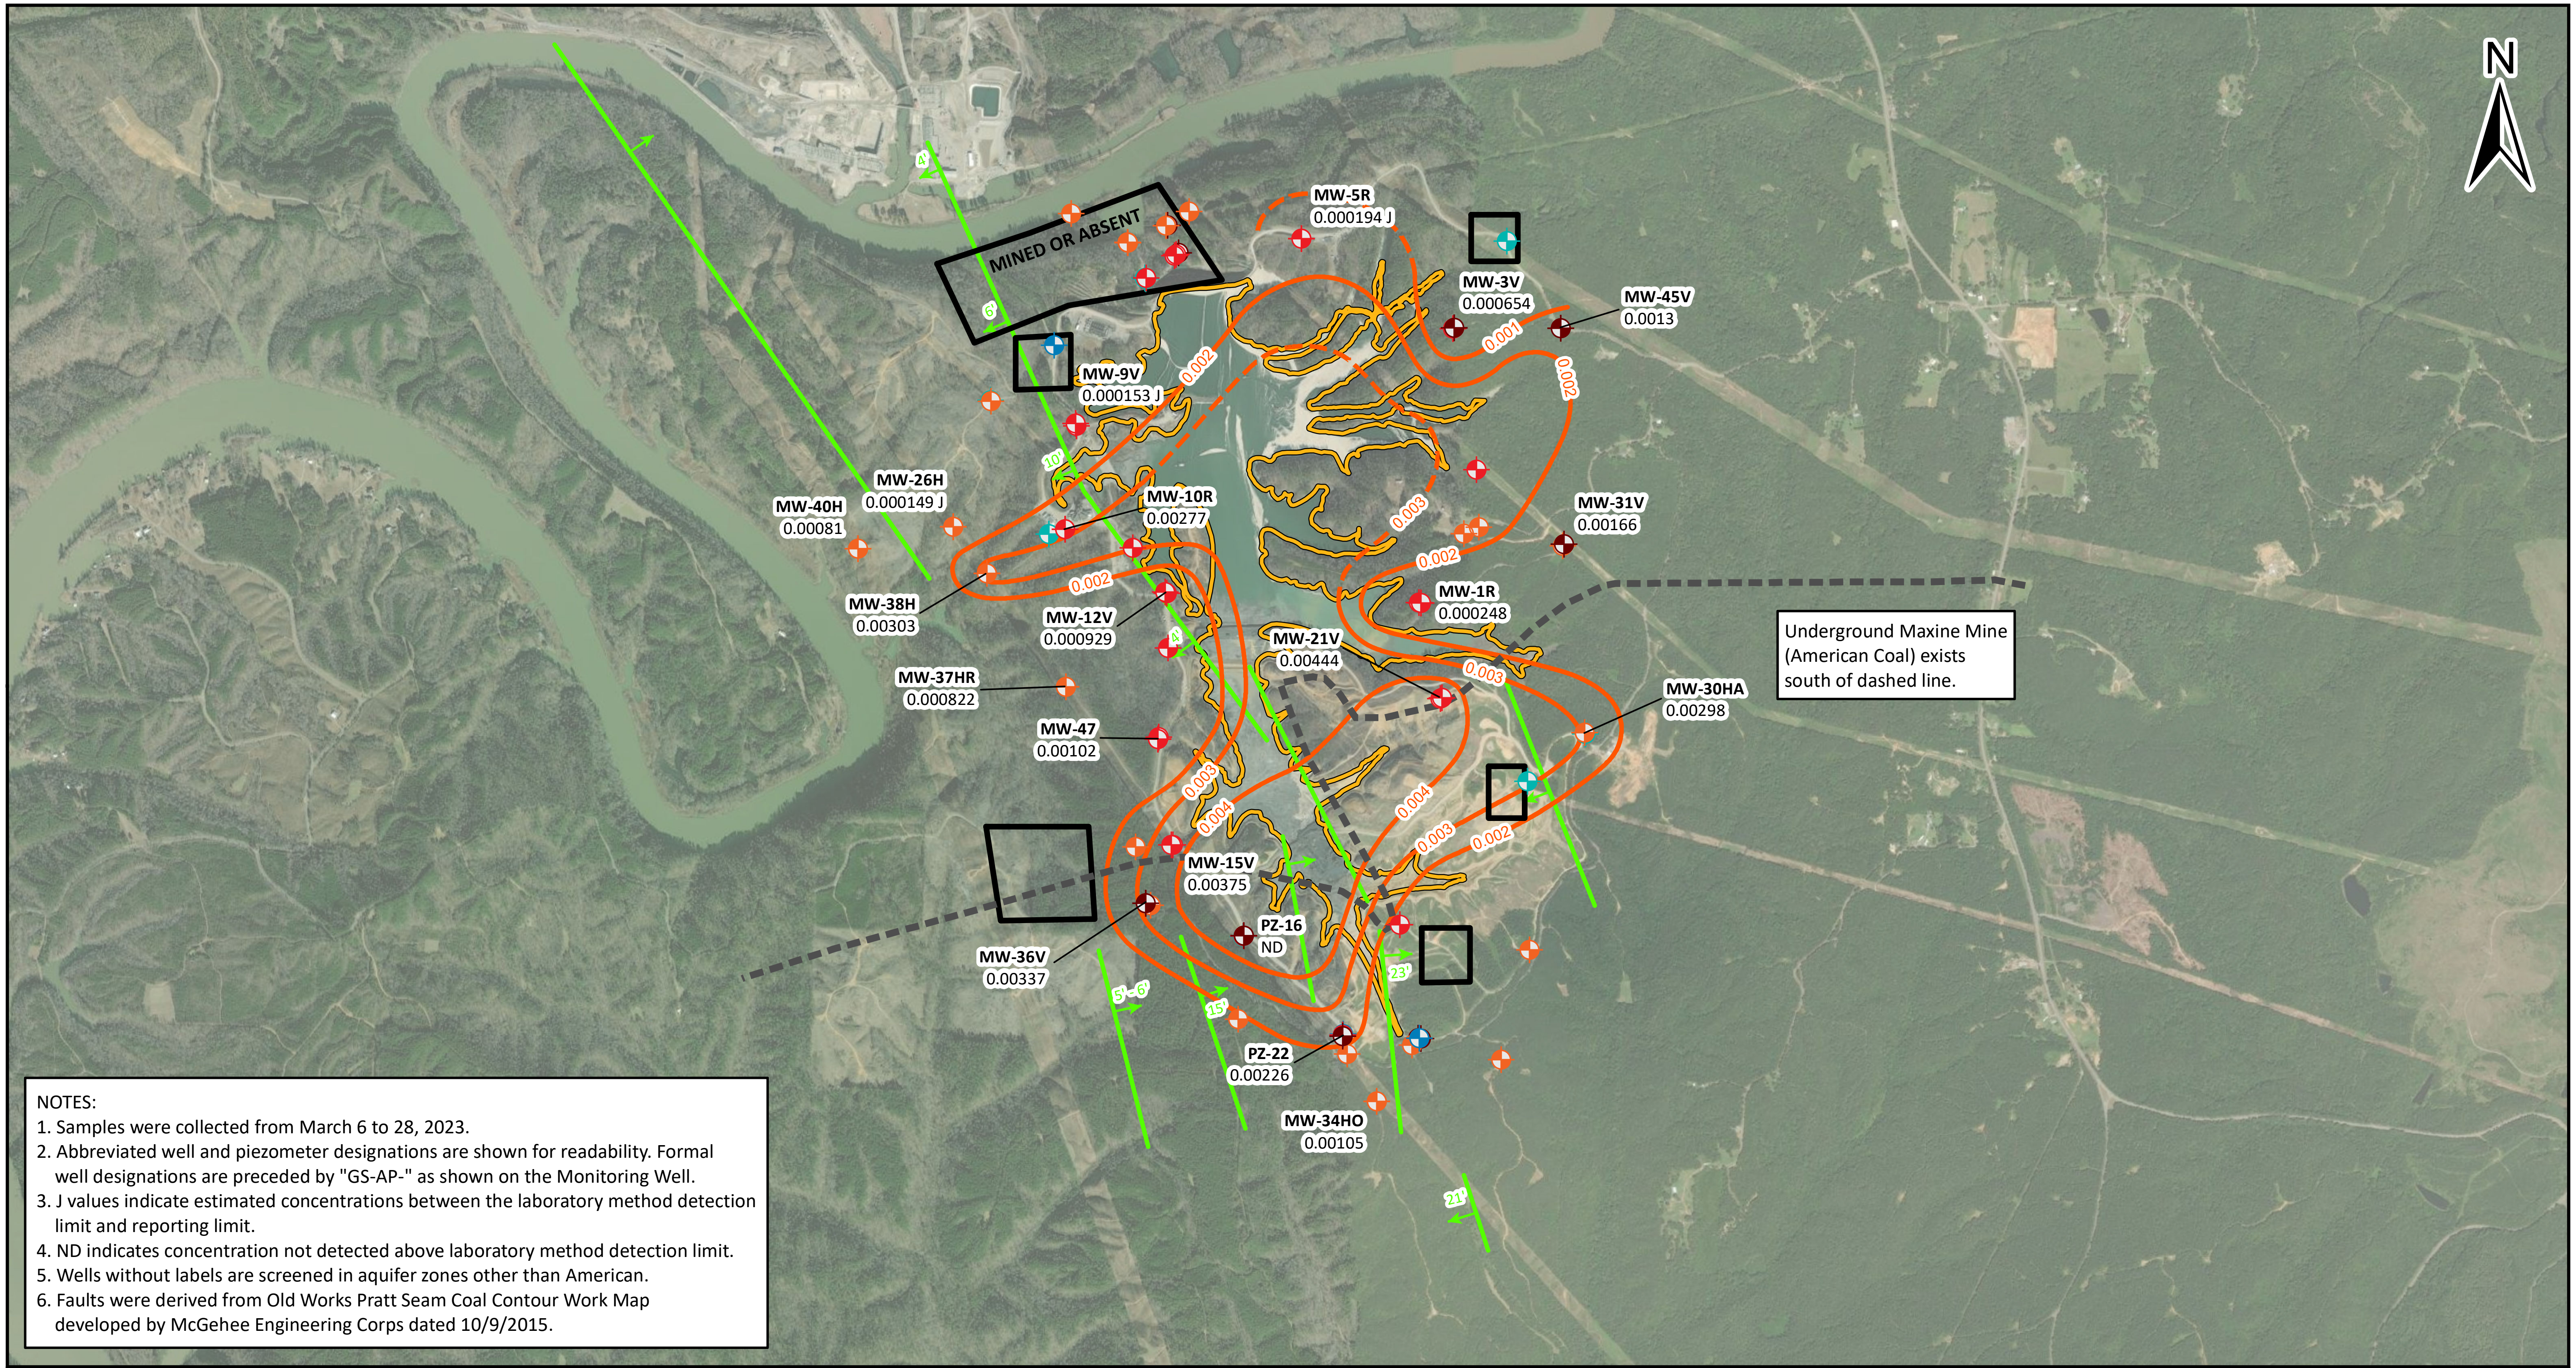
CHECKED BY	AWH		Southern Company



Underground Maxine Mine (American Coal) exists south of dashed line.

NOTES:
1. Samples were collected from August 30 to September 19, 2023.
2. ND indicates concentration not detected above laboratory method detection limit.
3. Abbreviated well and piezometer designations are shown for readability. Formal well designations are preceded by "GS-AP-" as shown on the Monitoring Well.
4. J values indicate estimated concentrations between the laboratory method detection limit and reporting limit.
5. Wells without labels are screened in aquifer zones other than American.
6. Faults were derived from Old Works Pratt Seam Coal Contour Work Map developed by McGehee Engineering Corps dated 10/9/2015.

NOTES:
1. Samples were collected from August 30 to September 19, 2023.
2. NS indicates not sampled.
3. Abbreviated well and piezometer designations are shown for readability. Formal well designations are preceded by "GS-AP-" as shown on the Monitoring Well Location Map.
4. Geochemical profiles of MW-15 and MW-21 indicate potential grout contamination and do not appear to be representative of groundwater.
5. Well locations were plotted in GIS using survey data, and, as such, well symbology for co-locatd wells overlap at the mapping scale utilized.
6. J values indicate estimated concentrations between the laboratory method detection limit and reporting limit.
7. Wells without labels are screened in aquifer zones other than Pratt or Pratt/Gillespy.
8. Concentrations underlined in blue exceed the site specific Groundwater Protection Standard (GWPS) of 0.0809 mg/L for Lithium.
9. Faults were derived from Old Works Pratt Seam Coal Contour Work Map developed by McGehee Engineering Corps dated 10/9/2015.

Table 2. Parameters And Reporting Limits

Plant Gorgas Ash Pond
03/06/2023 - 09/19/2023

Appendix III Parameters			
Parameters	**Analytical Methods**	**Reporting Limits**	**Units of Measure**
Boron	EPA 200.7	0.1015	mg/L
Calcium	EPA 200.7	0.406-40.599998	mg/L
Chloride	SM4500Cl E	1-100	mg/L
Fluoride	SM4500F G 2017	0.125	mg/L
pH_Field	Field Sampling	NA	SU
Sulfate	SM4500SO4 E 2011	2-100	mg/L
TDS	NA	NA	mg/L

Appendix IV Parameters			
Parameters	**Analytical Methods**	**Reporting Limits**	**Units of Measure**
Antimony	EPA 200.8	0.001015	mg/L
Arsenic	EPA 200.8	0.000203	mg/L
Barium	EPA 200.8	0.001015	mg/L
Beryllium	EPA 200.8	0.001015	mg/L
Cadmium	EPA 200.8	0.000203	mg/L
Chromium	EPA 200.8	0.001015	mg/L
Cobalt	EPA 200.8	0.000203	mg/L
Lead	EPA 200.8	0.000203	mg/L
Lithium	EPA 200.7	0.02	mg/L
Mercury	EPA 245.1	0.0005	mg/L
Molybdenum	EPA 200.7	0.01015	mg/L
	EPA 200.8	0.000203	mg/L
Selenium	EPA 200.8	0.001015	mg/L
Thallium	EPA 200.8	0.000203	mg/L
Combined Radium 226 + 228	Total Radium Calculation	0.796-2.94	pCi/L

Notes:
1. Reporting Limit values can display range depending upon matrix interferences and dilution factors
2. pH is a field acquired parameter and does not have a laboratory method or reporting limit
3. Combined Radium 226 + 228 – product of radium-226 + radium-228; reporting limits presented are sum of radium 226, radium 228 reporting limits
4. EPA 200.7 – EPA methodology for the "Determination of Metals and Trace Elements in Water and Wastes by Inductively Coupled Plasma-Atomic Emission Spectrometry"
5. EPA 200.8 - EPA methodology for the "Determination of Metals and Trace Elements in Water and Wastes by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS)"
6. SM 2320, 2540, 4500 – Standard Methods for Examination of Water and Wastewater.
7. Total Radium Calculation – Term used herein for EPA 9315 + EPA 9320
8. EPA 9315 – Used for Radium-226; SW-846: Alpha-Emitting Radium Isotopes, part of Test Methods for Evaluation Solid Waste, Physical/Chemical Methods
9. EPA 9320 – Used for Radium-228; SW-846: Alpha-Emitting Radium Isotopes, part of Test Methods for Evaluation Solid Waste, Physical/Chemical Methods

Plant Gorgas Ash Pond
03/06/2023 - 09/18/2023

GS-AP-MW-44HO				
Sample Date = 9/5/2023				
Analyte	**Units**	**Original Result**	**Duplicate Result**	**RPD (%)**
Barium	mg/L	0.0867	0.0838	3.40%
Lithium	mg/L	0.0475	0.0474	0.21%

Notes:
1. The RPD calculations presented are for analyte pairs where original and duplicate results are valid, unqualified detections.
2. RPD calculation results less than or equal to 20% are considered acceptable.
3. Results greater than 20% are given data validation flags to indicate RPD criteria failure. Communication to sampling team and lab may be necessary to explore nature of RPD failure(s).

Table 4b. - Field QC: Blank Detections

Plant Gorgas Ash Pond
03/06/2023 - 09/13/2023

Parameters Detected Above MDL					
Sample Date	**QC Location**	**Parameter**	**Blank Concentration**	**Units**	**MDL**
03/28/2023	FB-6	Fluoride	0.242 v	mg/L	0.06
08/31/2023	EB-1	Chromium	0.00021 J	mg/L	0.0002

03/06/2023	FB-1	Chromium	0.00026 J	mg/L	0.0002

Notes:
1. Lab qualifiers have been appended to result when applicable
2. MDL = Method Detection Limit
3. Only Appendix 4 Constituents were compared and validated. Radium data was not validated.
4. mg/L = milligrams per liter

Table 5. Summary of Background Levels and Groundwater Protection Standards

Plant Gorgas Ash Pond

Appendix IV Analytes			
Analyte	**Units**	**Background**	**GWPS**
Antimony	mg/L	0.00115	0.006
Arsenic	mg/L	0.005	0.01
Barium	mg/L	0.353	2
Beryllium	mg/L	0.001015	0.004
Cadmium	mg/L	0.000203	0.005
Chromium	mg/L	0.00405	0.1
Cobalt	mg/L	0.00362	0.006
Fluoride	mg/L	0.278	4
Lead	mg/L	0.000189	0.015
Lithium	mg/L	0.0809	0.0809
Mercury	mg/L	0.0005	0.002
Molybdenum	mg/L	0.01015	0.1
Selenium	mg/L	0.001015	0.05
Thallium	mg/L	0.000203	0.002
Combined Radium 226 + 228	pCi/L	1.25	5

Notes:
1. mg/L - Milligrams per liter
2. pCi/L - Picocuries per liter
3. Background concentrations/limits are used when determining the groundwater protection standard (GWPS) under 40 CFR §257.95(h) and ADEM Rule 335-13-15-.06(h).
4. GWPS are generally updated on a 2 year basis which began in the Fall of 2019 (Fall 2019, Fall 2021, etc).

Field Case Narrative

Gorgas Ash Pond

2023 Compliance Event 1

All samples were collected using methods defined in Alabama Power's Water Field Group Low-Flow Groundwater Sampling Procedure and the associated site-specific Sampling and Analysis Plan (SAP).

Turbidity levels less than 10 NTU were not able to be achieved after extended pumping for well MW-6V. A complete sample set for totals analysis was collected followed by a field filtered set for dissolved analysis.

Due to low yield, well MW-32H was sampled using the Minimal Purge Method, as defined in the SAP.

All pH field readings for well MW-16S and the first 2 pH field readings for MW-12 were qualified due to pH readings falling outside of the bracketed calibration range. The below qualifier was used:

- E – Estimated reported value exceeded calibration range

Field quality control procedures were performed as follows:

- Blanks and Sample Duplicates were collected as described in the SAP.
    - Field Blank 6 (FB-6) had results above the reporting limit (RL) for Fluoride.

- Calibration verifications for all required field parameters were performed daily, before and after sample collection.

May 03, 2023

Dear Dustin Brooks,

Enclosed are the analytical results for sample(s) received by the laboratory between March 09, 2023 and March 29, 2023. All results reported herein conform to the laboratory's most current Quality Assurance Manual. Results marked with an asterisk conform to the most current applicable TNI/NELAC requirements. Exceptions will be noted in the body of the report.

Laboratory certification ID: E571114
Issued By: State of Florida, Department of Health
Expiration: June 30, 2023

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Quality Control: Brooke Caton

4. All of the above samples were analyzed by EPA 200.7 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.

6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed, and all criteria were met.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were analyzed, and all criteria were met.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- All calibration curve requirements were within acceptance criteria.
- All sample internal standard criteria were met.
- The spectral interference check associated with EPA 200.7 was analyzed and all acceptance criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for accuracy were met, except for the following:
    - BD04999, BD05859, BD06139, & BD06149 Sodium MS/MSD spike levels were less than 30% of the sample concentrations.
    - BD05373 Iron, Sodium, and Silicon MS/MSD spike levels were less than 30% of the sample concentrations.
- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for precision were met.

7. The following sample was diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

Sample ID	**Analyte**	**Dilution Factor**
BD04999	Sodium	10.15

BD05364	Calcium, Sodium	10.15
BD05365	Calcium	10.15

4. All of the above samples were analyzed and prepared by EPA 200.7 for dissolved analysis.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed, and all criteria were met.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.

- All continued calibration blanks (CCB) were analyzed, and all criteria were met.
- Due to no filtered method blank (MB) or laboratory control sample (LCS) submitted with the sample set, an unfiltered MB and LCS were analyzed with the samples in each batch.
- All laboratory control sample criteria were met.
- The method blank associated with each batch passed all acceptance criteria for all requested analytes.
- All calibration curve requirements were within acceptance criteria.
- All sample internal standard criteria were met.
- The spectral interference check associated with EPA 200.7 was analyzed and all acceptance criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were analyzed with each ICP batch. All acceptance criteria for accuracy were met except for the following:
    - BD04999, BD05373, BD05872, BD06140, & BD06149 Sodium MS/MSD spike levels were less than 30% of the sample concentrations.
    - BD05382 Calcium and Magnesium MS/MSD spike levels were less than 30% of the sample concentrations.
    - BD05860 Calcium, Magnesium and Sodium MS/MSD spike levels were less than 30% of the sample concentrations.
    - BD05857, & BD05872 Calcium MS/MSD spike levels were less than 30% of the sample concentrations.
- A matrix spike and matrix spike duplicate were analyzed with each ICP batch. All acceptance criteria for precision were met.

7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

Sample ID	Analyte	Dilution Factor
BD04999	Sodium	10.15
BD05364	Calcium, Sodium	10.15
BD05365	Sodium	101.5
BD05366	Calcium, Sodium	101.5

4. All of the above samples were analyzed by EPA 200.8 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.

6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All tune and calibration met criteria for all requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- The interference check samples associated with EPA 200.8 were analyzed and passed for all requested analytes.
- All sample internal standard criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for accuracy were met, except for the following:
    - BD04999 Aluminum MS/MSD spike levels were less than 30% of the sample concentrations.
    - BD05373 Aluminum MS and/or MSD recovery is outside of specification limit.
    - BD05859 Barium MS/MSD spike levels were less than 30% of the sample concentrations.
    - BD06139 Selenium MS and/or MSD recovery is outside of specification limit.
- A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for precision were met.

7. All samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

Sample ID	Analyte	Dilution Factor
BD05374	Manganese	5.075

Case Narrative

BD05375	Manganese	5.075
BD05378	Manganese	5.075
BD05855	Aluminum	5.075

8. The raw data results are shown with dilution factors included.

4. All of the above samples were analyzed and prepared by EPA 245.1.
5. All samples were prepared and analyzed within the established hold times.

6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the method detection limit for the requested analyte.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analyte.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analyte.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch was below the limit of quantitation for the requested analyte.
- All calibration met criteria for the requested analyte.
- All response signals were satisfactory.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each analytical batch. All acceptance criteria for accuracy were met.
- A matrix spike and matrix spike duplicate were digested and analyzed with each analytical batch. All acceptance criteria for precision were met.

7. All samples were analyzed without a dilution factor.

4. All of the above samples were prepared and analyzed by Standard Method 2540C.

Revision 5

5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- A Method Blank was analyzed with each batch. All criteria were met.
- All final weights of samples, standards, and blanks agreed within 0.5mg of the previous weight.
- A sample duplicate was analyzed with each batch, and RPD was ≤ 10%.
- A laboratory control sample was analyzed with each batch. All criteria were met.
- Samples were between 2.5mg and 200mg residue.
- All samples with residue <2.5mg had the maximum volume of 150mL filtered. Affected samples are as follows:
    - BD05383
    - BD05851
    - BD05863
    - BD05868
    - BD05876
    - BD06133

BD06149	752110, 752111, 751112	WMWGORAP_1400

4. All of the above samples were prepared and analyzed by Standard Method 2320B.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- An initial pH check was analyzed with each batch. The acceptance criteria were met.
- A final pH check was analyzed with each batch. The acceptance criteria were met.

- An alkalinity laboratory control sample was analyzed with each batch. Range criteria of within 10% of true value was met.
- An alkalinity sample duplicate was analyzed with each batch. Precision criteria less than 10 RPD was met.

7. The following samples had pH>10 and/or TDS>500mg/L. Therefore, the calculations for carbonate and bicarbonate are estimates:
    - BD04999
    - BD05000
    - BD05364
    - BD05365
    - BD05366
    - BD05378
    - BD05382
    - BD05850
    - BD05852
    - BD05856
    - BD05857
    - BD05858
    - BD05860
    - BD05872
    - BD06134
    - BD06135
    - BD06136
    - BD06137
8. The following samples had pH>12. Therefore, the calculations for carbonate and bicarbonate are invalid and not reported:
    - BD05855

4. All of the above samples were analyzed and prepared by SM4500 Cl E, SM4500 F G, and SM4500 SO4 E.

5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All calibration met criteria for the requested analyte.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and was below half the limit of quantitation for the requested analyte.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analyte.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analyte.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for accuracy were met.
- A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for precision were met.

7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

Sample ID	Analyte	Dilution Factor
BD04999	Chloride	4
BD05000	Chloride	5
BD05364	Sulfate	16
BD05365	Chloride, Sulfate	32, 25
BD05366	Chloride, Sulfate	100, 40
BD05368	Chloride, Sulfate	4, 2
BD05371	Chloride, Sulfate	8, 5
BD05372	Sulfate	4
BD05373	Sulfate	8
BD05374	Sulfate	4
BD05375	Sulfate	4
BD05376	Sulfate	2

BD05377	Sulfate	5
BD05378	Sulfate	20
BD05379	Sulfate	5
BD05382	Sulfate	20
BD05850	Chloride, Sulfate	50, 8

4. All of the above samples were prepared and analyzed for NO_x by EPA 353.2.

Revision 5

5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Water baseline report was run and met criteria.
- All calibration met criteria for the requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and met all criteria.
- All continued calibration verification (CCV) were within the acceptance criteria.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and were below limit of detection.
- All continued calibration blanks (CCB) were below the limit of detection.

EPA 353.2 Specific QC:

- Prior to sample analysis, Cadmium coil reduction efficiency check met criteria.
- Matrix Specific QC:
  - A sample duplicate was run and criteria for precision was met.
  - A matrix spike was run and criteria for accuracy was met, except for the following:
    - BD05000 MS and/or MSD recovery passes using values below the detection limit.

7. All samples were analyzed without a dilution factor.
8. The raw data results are shown with dilution factors included.

4. All of the above samples were prepared and analyzed by Standard Method 5310B.

5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All calibration criteria were met.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and met all criteria.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and was <1/2RL.
- All continued calibration verifications (CCVs) were within the acceptance range.
- All continued calibration blanks (CCBs) were <1/2RL.

Matrix Specific Quality Control Procedures:

- A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for accuracy were met.
- A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for precision were met.

7. All samples were analyzed without a dilution factor.
8. The raw data results are shown with dilution factors included.

Definitions

Project Number: WMWGORAP_1400

Abbreviation	Description
DF	Dilution Factor
LCS	Lab Control Sample
LFM	Lab Fortified Matrix
MB	Method Blank
MDL	Method Detection Limit; minimum concentration of an analyte that can be determined with 99% confidence that the concentration is greater than zero.
MS	Matrix Spike
MSD	Matrix Spike Duplicate
Prec	Precision (% RPD)
Q	Qualifier; comment used to note deviations or additional information associated with analytical results.
QC	Quality Control
Rec	Recovery of Matrix Spike
RL	Reporting Limit; lowest concentration at which an analyte can be quantitatively measured.
Vio Spec	Violation Specification; regulatory limit which has been exceeded by the sample analyzed.

Qualifier	Description
A	Bicarbonate alkalinity, carbonate alkalinity, hydroxide alkalinity, free carbon dioxide, and/or total carbon dioxide calculations are estimates due to pH>10SU and/or TDS>500mg/L.
AI	Bicarbonate alkalinity, carbonate alkalinity, hydroxide alkalinity, free carbon dioxide, and/or total carbon dioxide calculations are invalid due to pH>12SU and not reported.
FA	Field results were reviewed by the Water Field Group. Refer to APC Field Case Narrative.
J	Reported value is an estimate because concentration is less than reporting limit.
R	Matrix spike recovery and/or matrix spike duplicate recovery is outside of specification limit.
RA	Matrix spike is invalid due to sample concentration.
U	Compound was analyzed, but not detected.

April 25, 2023

Dear Dustin Brooks,

Enclosed are the analytical results for sample(s) received by the laboratory between March 09, 2023 and March 16, 2023. All results reported herein conform to the laboratory's most current Quality Assurance Manual. Results marked with an asterisk conform to the most current applicable TNI/NELAC requirements. Exceptions will be noted in the body of the report.

Laboratory certification ID: E571114
Issued By: State of Florida, Department of Health
Expiration: June 30, 2023

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Quality Control: Brooke Caton

Case Narrative

Total Metals ICP

Gorgas Ash Pond

WMWGORAP_1403

1. This report consists of all MWs and corresponding Lab IDs listed on the Chain of Custody.
2. Refer to comments on Chain of Custody for information regarding sample receipt.
3. All standards and solutions meet NELAP traceability requirements and were used within their recommended shelf life.

Sample ID	Batch ID	Project ID
BD04989	749819	WMWGORAP_1403
BD04990	749819	WMWGORAP_1403
BD04991	749819	WMWGORAP_1403
BD04992	749819	WMWGORAP_1403
BD04993	749819	WMWGORAP_1403
BD05362	750100	WMWGORAP_1403

4. All of the above samples were analyzed by EPA 200.7 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed, and all criteria were met.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were analyzed, and all criteria were met.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- All calibration curve requirements were within acceptance criteria.
- All sample internal standard criteria were met.
- The spectral interference check associated with EPA 200.7 was analyzed and all acceptance criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Revision 5

Case Narrative

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for accuracy were met, except for the following:
    - BD05362 Sodium MS/MSD spike levels were less than 30% of the sample concentrations.
- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for precision were met.

7. The following sample was diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

Sample ID	**Analyte**	**Dilution Factor**
BD04990	Sodium	10.15
BD04991	Calcium, Sodium	101.5
BD04992	Calcium, Sodium	101.5
BD05362	Sodium	10.15

8. The raw data results are shown with dilution factors included.

4. All of the above samples were analyzed and prepared by EPA 200.7 for dissolved analysis.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed, and all criteria were met.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were analyzed, and all criteria were met.
- Due to no filtered method blank (MB) or laboratory control sample (LCS) submitted with the sample set, an unfiltered MB and LCS were analyzed with the samples in each batch.
- All laboratory control sample criteria were met.
- The method blank associated with each batch passed all acceptance criteria for all requested analytes.
- All calibration curve requirements were within acceptance criteria.
- All sample internal standard criteria were met.
- The spectral interference check associated with EPA 200.7 was analyzed and all acceptance criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. 4. All of the above samples were analyzed and prepared by EPA 245.1.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the method detection limit for the requested analyte.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analyte.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analyte.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch was below the limit of quantitation for the requested analyte.
- All calibration met criteria for the requested analyte.
- All response signals were satisfactory.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

Revision 5

- A matrix spike and matrix spike duplicate were digested and analyzed with each analytical batch. All acceptance criteria for accuracy were met.
- A matrix spike and matrix spike duplicate were digested and analyzed with each analytical batch. All acceptance criteria for precision were met.

7. All samples were analyzed without a dilution factor.

4. All of the above samples were prepared and analyzed by Standard Method 2540C.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- A Method Blank was analyzed with each batch. All criteria were met.
- All final weights of samples, standards, and blanks agreed within 0.5mg of the previous weight.
- A sample duplicate was analyzed with each batch, and RPD was ≤ 10%.
- A laboratory control sample was analyzed with each batch. All criteria were met.
- Samples were between 2.5mg and 200mg residue.
- All samples with residue <2.5mg had the maximum volume of 150mL filtered. Affected samples are as follows:
    - BD04989
    - BD04993

4. All of the above samples were analyzed and prepared by SM4500 Cl E, SM4500 F G, and SM4500 SO4 E.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All calibration met criteria for the requested analyte.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and was below half the limit of quantitation for the requested analyte.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analyte.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analyte.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

Revision 5

- A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for accuracy were met.
- A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for precision were met.

7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

Sample ID	Analyte	Dilution Factor
BD04991	Chloride, Sulfate	50, 50
BD04992	Chloride, Sulfate	50, 50

8. The raw data results are shown with dilution factors included.

Case Narrative

Nitrate-Nitrite

Gorgas Ash Pond

WMWGORAP_1403

1. This report consists of all MWs and corresponding Lab IDs listed on the Chain of Custody.
2. Refer to comments on Chain of Custody for information regarding sample receipt.
3. All standards and solutions meet NELAP traceability requirements and were used within their recommended shelf life.

Sample ID	Batch ID	Project ID
BD04989	749700	WMWGORAP_1403
BD04990	749700	WMWGORAP_1403
BD04991	749700	WMWGORAP_1403
BD04992	749700	WMWGORAP_1403
BD04993	749700	WMWGORAP_1403
BD05362	750387	WMWGORAP_1403

4. All of the above samples were prepared and analyzed for NO_x by EPA 353.2.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Water baseline report was run and met criteria.
- All calibration met criteria for the requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and met all criteria.
- All continued calibration verification (CCV) were within the acceptance criteria.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and were below limit of detection.
- All continued calibration blanks (CCB) were below the limit of detection.

EPA 353.2 Specific QC:

- Prior to sample analysis, Cadmium coil reduction efficiency check met criteria.
- Matrix Specific QC:
  - A sample duplicate was run and criteria for precision was met.
  - A matrix spike was run and criteria for accuracy was met.

7. All samples were analyzed without a dilution factor.
8. The raw data results are shown with dilution factors included.

4. All of the above samples were prepared and analyzed by Standard Method 5310B.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All calibration criteria were met.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and met all criteria.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and was <1/2RL.
- All continued calibration verifications (CCVs) were within the acceptance range.
- All continued calibration blanks (CCBs) were <1/2RL.

Matrix Specific Quality Control Procedures:

- A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for accuracy were met.
- A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for precision were met.

7. All samples were analyzed without a dilution factor.
8. The raw data results are shown with dilution factors included.

Definitions

Project Number: WMWGORAP_1403

Abbreviation	Description
DF	Dilution Factor
LCS	Lab Control Sample
LFM	Lab Fortified Matrix
MB	Method Blank
MDL	Method Detection Limit; minimum concentration of an analyte that can be determined with 99% confidence that the concentration is greater than zero.
MS	Matrix Spike
MSD	Matrix Spike Duplicate
Prec	Precision (% RPD)
Q	Qualifier; comment used to note deviations or additional information associated with analytical results.
QC	Quality Control
Rec	Recovery of Matrix Spike
RL	Reporting Limit; lowest concentration at which an analyte can be quantitatively measured.
Vio Spec	Violation Specification; regulatory limit which has been exceeded by the sample analyzed.

Qualifier	Description
A	Bicarbonate alkalinity, carbonate alkalinity, hydroxide alkalinity, free carbon dioxide, and/or total carbon dioxide calculations are estimates due to pH>10SU and/or TDS>500mg/L.
FA	Field results were reviewed by the Water Field Group. Refer to APC Field Case Narrative.
J	Reported value is an estimate because concentration is less than reporting limit.
RA	Matrix spike is invalid due to sample concentration.
U	Compound was analyzed, but not detected.

April 12, 2023

Dear Dustin Brooks,

Enclosed are the analytical results for sample(s) received by the laboratory on March 07, 2023.
All results reported herein conform to the laboratory’s most current Quality Assurance Manual. Results marked with an asterisk conform to the most current applicable TNI/NELAC requirements. Exceptions will be noted in the body of the report.

Laboratory certification ID: E571114
Issued By: State of Florida, Department of Health
Expiration: June 30, 2023

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Quality Control: Brooke Caton

Case Narrative

Total Metals ICP

Gorgas Ash Pond

WMWGORAP_1402

1. This report consists of all MWs and corresponding Lab IDs listed on the Chain of Custody.
2. Refer to comments on Chain of Custody for information regarding sample receipt.
3. All standards and solutions meet NELAP traceability requirements and were used within their recommended shelf life.

Sample ID	Batch ID	Project ID
BD04765	749271	WMWGORAP_1402
BD04766	749271	WMWGORAP_1402
BD04767	749271	WMWGORAP_1402
BD04768	749271	WMWGORAP_1402

4. All of the above samples were analyzed by EPA 200.7 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed, and all criteria were met.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were analyzed, and all criteria were met.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- All calibration curve requirements were within acceptance criteria.
- All sample internal standard criteria were met.
- The spectral interference check associated with EPA 200.7 was analyzed and all acceptance criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Revision 5

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for accuracy were met.
- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for precision were met.

7. The following sample was diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

Sample ID	Analyte	Dilution Factor
BD04765	Sodium	10.15
BD04766	Sodium	10.15

8. The raw data results are shown with dilution factors included.

BD04765	749273	WMWGORAP_1402
BD04766	749273	WMWGORAP_1402

4. All of the above samples were analyzed and prepared by EPA 200.7 for dissolved analysis.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed, and all criteria were met.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were analyzed, and all criteria were met.
- Due to no filtered method blank (MB) or laboratory control sample (LCS) submitted with the sample set, an unfiltered MB and LCS were analyzed with the samples in each batch.
- All laboratory control sample criteria were met.
- The method blank associated with each batch passed all acceptance criteria for all requested analytes.
- All calibration curve requirements were within acceptance criteria.
- All sample internal standard criteria were met.
- The spectral interference check associated with EPA 200.7 was analyzed and all acceptance criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

Revision 5

- A matrix spike and matrix spike duplicate were analyzed with each ICP batch. All acceptance criteria for accuracy were met except for the following:
    - BD04766 Sodium MS/MSD spike levels were less than 30% of the sample concentrations.
- A matrix spike and matrix spike duplicate were analyzed with each ICP batch. All acceptance criteria for precision were met.

7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

Sample ID	**Analyte**	**Dilution Factor**
BD04765	Sodium	10.15
BD04766	Sodium	10.15

8. The raw data results are shown with dilution factors included.

BD04768	749687	WMWGORAP_1402

4. All of the above samples were analyzed by EPA 200.8 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All tune and calibration met criteria for all requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- The interference check samples associated with EPA 200.8 were analyzed and passed for all requested analytes.
- All sample internal standard criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Revision 5

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for accuracy were met.
- A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for precision were met.

7. All samples were analyzed without a dilution factor.
8. The raw data results are shown with dilution factors included.

4. All of the above samples were analyzed and prepared by EPA 200.8 for dissolved analysis.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All tune and calibration met criteria for all requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- Due to no filtered method blank (MB) or laboratory control sample (LCS) submitted with the sample set, an unfiltered MB and LCS were analyzed with the samples in each batch.
- All laboratory control sample criteria were met.
- The method blank associated with each preparation batch passed all acceptance criteria for all requested analytes.
- The interference check samples associated with EPA 200.8 were analyzed and passed for all requested analytes.
- All sample internal standard criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. 4. All of the above samples were analyzed and prepared by EPA 245.1.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the method detection limit for the requested analyte.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analyte.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analyte.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch was below the limit of quantitation for the requested analyte.
- All calibration met criteria for the requested analyte.
- All response signals were satisfactory.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each analytical batch. All acceptance criteria for accuracy were met.

Revision 5

- A matrix spike and matrix spike duplicate were digested and analyzed with each analytical batch. All acceptance criteria for precision were met.

7. All samples were analyzed without a dilution factor.

4. All of the above samples were prepared and analyzed by Standard Method 2540C.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- A Method Blank was analyzed with each batch. All criteria were met.
- All final weights of samples, standards, and blanks agreed within 0.5mg of the previous weight.
- A sample duplicate was analyzed with each batch, and RPD was ≤ 10%.
- A laboratory control sample was analyzed with each batch. All criteria were met.
- Samples were between 2.5mg and 200mg residue.
- All samples with residue <2.5mg had the maximum volume of 150mL filtered. Affected samples are as follows:
    - BD04767
    - BD04768

4. All of the above samples were analyzed and prepared by SM4500 Cl E, SM4500 F G, and SM4500 SO4 E.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All calibration met criteria for the requested analyte.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and was below half the limit of quantitation for the requested analyte.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analyte.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analyte.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for accuracy were met.

Revision 5

- A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for precision were met.

7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

Sample ID	Analyte	Dilution Factor
BD04765	Chloride	4
BD04766	Chloride	4

8. The raw data results are shown with dilution factors included.

BD04768	749699	WMWGORAP_1402

4. All of the above samples were prepared and analyzed for NO_x by EPA 353.2.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Water baseline report was run and met criteria.
- All calibration met criteria for the requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and met all criteria.
- All continued calibration verification (CCV) were within the acceptance criteria.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and were below limit of detection.
- All continued calibration blanks (CCB) were below the limit of detection.

EPA 353.2 Specific QC:

- Prior to sample analysis, Cadmium coil reduction efficiency check met criteria.
- Matrix Specific QC:
    - A sample duplicate was run and criteria for precision was met.
    - A matrix spike was run and criteria for accuracy was met.

7. All samples were analyzed without a dilution factor.
8. The raw data results are shown with dilution factors included.

Definitions

Project Number: WMWGORAP_1402

Abbreviation	Description
DF	Dilution Factor
LCS	Lab Control Sample
LFM	Lab Fortified Matrix
MB	Method Blank
MDL	Method Detection Limit; minimum concentration of an analyte that can be determined with 99% confidence that the concentration is greater than zero.
MS	Matrix Spike
MSD	Matrix Spike Duplicate
Prec	Precision (% RPD)
Q	Qualifier; comment used to note deviations or additional information associated with analytical results.
QC	Quality Control
Rec	Recovery of Matrix Spike
RL	Reporting Limit; lowest concentration at which an analyte can be quantitatively measured.
Vio Spec	Violation Specification; regulatory limit which has been exceeded by the sample analyzed.

Qualifier	Description
FA	Field results were reviewed by the Water Field Group. Refer to APC Field Case Narrative.
J	Reported value is an estimate because concentration is less than reporting limit.
RA	Matrix spike is invalid due to sample concentration.
U	Compound was analyzed, but not detected.

RE: Project: WMWGORAP_1400
Pace Project No.: 30576856

Dear Brooke Caton:

Enclosed are the analytical results for sample(s) received by the laboratory on April 05, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Skyler Richmond

PROJECT NARRATIVE

Project:	WMWGORAP_1400
Pace Project No.:	30576856

Method: **EPA 9315**
Description: 9315 Total Radium
Client: Alabama Power
Date: May 16, 2023

General Information:
78 samples were analyzed for EPA 9315 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

Method:	**EPA 9320**
Description:	9320 Radium 228
Client:	Alabama Power
Date:	May 16, 2023

General Information:
78 samples were analyzed for EPA 9320 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

PROJECT NARRATIVE

Project:	WMWGORAP_1400
Pace Project No.:	30576856

Method: **Total Radium Calculation**
Description: Total Radium 228+226
Client: Alabama Power
Date: May 16, 2023

General Information:
70 samples were analyzed for Total Radium Calculation by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

This data package has been reviewed for quality and completeness and is approved for release.

QUALIFIERS

Project:	WMWGORAP_1400
Pace Project No.:	30576856

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Act - Activity

Unc - Uncertainty: For Safe Drinking Water Act (SDWA) analyses, the reported Unc. Is the calculated Count Uncertainty (95% confidence interval) using a coverage factor of 1.96. For all other matrices (non-SDWA), the reported Unc. is the calculated Expanded Uncertainty (aka Combined Standard Uncertainty, CSU), reported at the 95% confidence interval using a coverage factor of 1.96.

Gamma Spec: The Unc. reported for all gamma-spectroscopy analyses (EPA 901.1), is the calculated Expanded Uncertainty (CSU) at the 95.4% confidence interval, using a coverage factor of 2.0.

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

CHAIN-OF-CUSTODY / Analytical Request Document

The Chain-of-Custody is a LEGAL DOCUMENT. All relevant fields must be completed accurately.

Page : 1 Of

Section A
Required Client Information:

Company:	Alabama Power Company
Address:	744 Highway 87 GSC Bldg #8 Calera, AL 35040
Email To:	tbwill@southernco.com
Phone:	205-664-6101 Fax:
Requested Due Date:	Normal

Section B
Required Project Information:

Report To:	Brooke Caton
Copy To:	Renee Jernigan & Blaine Denton
Purchase Order #:	APC10755638
Project Name:	Plant Gorgas Ash Pond
Project Number:	WMWGORAP_1400

Section C
Invoice Information:

Attention:	Brooke Caton
Company Name:	Alabama Power Co.
Address:	744 Highway 87 GSC Bldg #8
Pace Quote:	CCR
Pace Project Manager:	Skyler Richmond
Pace Profile #:	16788

Regulatory Agency
State / Location
AL

RE: Project: WMWGORAP_1403
Pace Project No.: 30579206

Dear Brooke Caton:

Enclosed are the analytical results for sample(s) received by the laboratory on April 14, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Skyler C. Richmond

PASI-PA = Pace Analytical Services - Greensburg

PROJECT NARRATIVE

Project: WMWGORAP_1403
Pace Project No.: 30579206

Method: **EPA 9315**
Description: 9315 Total Radium
Client: Alabama Power
Date: May 16, 2023

General Information:
8 samples were analyzed for EPA 9315 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

PROJECT NARRATIVE

Project: WMWGORAP_1403
Pace Project No.: 30579206

Method: **EPA 9320**
Description: 9320 Radium 228
Client: Alabama Power
Date: May 16, 2023

General Information:
8 samples were analyzed for EPA 9320 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

Pace Project No.:	30579206

Method: **Total Radium Calculation**
Description: Total Radium 228+226
Client: Alabama Power
Date: May 16, 2023

General Information:

6 samples were analyzed for Total Radium Calculation by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:

All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

This data package has been reviewed for quality and completeness and is approved for release.

QUALIFIERS

Project:	WMWGORAP_1403
Pace Project No.:	30579206

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Act - Activity

Unc - Uncertainty: For Safe Drinking Water Act (SDWA) analyses, the reported Unc. Is the calculated Count Uncertainty (95% confidence interval) using a coverage factor of 1.96. For all other matrices (non-SDWA), the reported Unc. is the calculated Expanded Uncertainty (aka Combined Standard Uncertainty, CSU), reported at the 95% confidence interval using a coverage factor of 1.96.

Gamma Spec: The Unc. reported for all gamma-spectroscopy analyses (EPA 901.1), is the calculated Expanded Uncertainty (CSU) at the 95.4% confidence interval, using a coverage factor of 2.0.

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)
