CERTIFICATION STATEMENT

This 2023 Annual Groundwater Monitoring and Corrective Action Report, Alabama Power Company - Plant Miller Ash Pond has been prepared in accordance with the United States Environmental Protection Agency's coal combustion residual rule (40 CFR Part 257, Subpart D) and ADEM Admin. Code r. 335-13-15 and Part E of ADEM Administrative Order No. 18-098-GW, under the supervision of a licensed professional engineer in the State of Alabama. As such, I certify that the information contained herein is true and accurate to the best of my knowledge.

1/31/2024

EXECUTIVE SUMMARY

In accordance with the United States Environmental Protection Agency (EPA) coal combustion residual (CCR) rule (40 CFR Part 257, Subpart D), the State of Alabama Department of Environmental Management (ADEM) Admin. Code Ch. 335-13-15, and ADEM Administrative Order (AO) No. 18-098-GW, this 2023 Annual Groundwater Monitoring and Corrective Action Report has been prepared to document the first and second 2023 semi-annual groundwater monitoring activities at the Alabama Power Company (APC) Plant Miller Ash Pond (Site) and to satisfy the requirements of 40 CFR § 257.90(e), ADEM Admin. Code r. 335-13-15-.06(1)(e), and Part E of AO 18-098-GW. Semi-annual monitoring and associated reporting for Plant Miller Ash Pond is performed in accordance with the monitoring requirements 40 CFR § 257.90 through § 257.98 and ADEM Admin. Code r. 335-13-15-.06(1) through r. 335-13-15-.06(9).

The CCR unit began the monitoring period in corrective action pursuant to 40 CFR § 257.98 and ADEM Admin. Code r. 335-13-15-.06(9). Statistically significant increases (SSI) of Appendix III constituents over background were identified in the results of the first detection monitoring event and assessment monitoring was initiated in January 2018. Statistically significant levels (SSL) of Appendix IV parameters above groundwater protection standards (GWPS) were identified while in assessment monitoring. Consequently, an assessment of corrective measures (ACM) was initiated on January 13, 2019, and completed on June 12, 2019, according to the requirements of 40 CFR § 257.96, ADEM Admin. Code r. 335-13-15-.06(7), and ADEM Administrative Order No.18-098-GW. The ACM was subsequently submitted to the Agency and posted to the Site CCR compliance web site.

Since the submittal of the ACM, extensive Site investigations have been performed to select effective corrective measures to address SSL above GWPS. A Groundwater Remedy Selection Report was prepared to meet the requirements of 40 CFR § 257.97, ADEM Admin. Code r. 335-13-15-.06(8), and Part C of AO No.18-098-GW and submitted to ADEM on November 30, 2021. Subsequently, within 90 days of remedy selection a Corrective Action Groundwater Monitoring Program document presenting the groundwater corrective action remedies to be implemented was submitted on February 28, 2022.

The Corrective Action Groundwater Monitoring Program was prepared to meet 40 CFR § 257.98 and ADEM Admin. Code r. 335-13-15-.06(9) to detect potential downgradient changes in groundwater quality and assess the efficacy of the selected groundwater corrective action remedies. The Monitoring Program has been developed to meet the requirements of 40 CFR § 257.98(a)(1) and ADEM Admin.

Code r. 335-13-15-.06(9)(a)(1) and will supplement the ongoing CCR compliance groundwater monitoring currently being performed at the Site.

SSL of Appendix IV parameters arsenic, cobalt, lithium, and molybdenum were detected above GWPS during the first and second semi-annual monitoring events of 2023. The following summarizes activities for the annual monitoring period at the Site:

- Submitted the 2022 Annual Groundwater Monitoring and Corrective Action Report on January 31, 2023.
- Completed the first semi-annual assessment groundwater monitoring event between April 18, 2023 and May 3, 2023, and submitted the Semi-Annual Groundwater Monitoring and Corrective Action Report summarizing the findings to ADEM on July 31, 2023.
- Completed the second semi-annual assessment groundwater monitoring event between September 25, 2023 and October 12, 2023.
- Research for the in-situ groundwater treatment of Site constituents of interest (COI) as part of a Pre-Design Investigation (PDI) for a Permeation Grouting and/or Geochemical Injection Pilot Program. Geochemical manipulation was originally not selected as corrective measure, however, because it may be a viable remedial technology it has been included as part of the PDI. This research included:
 - Completed all screening batch tests and optimization batch tests for laboratory treatability studies. The findings are summarized in the Plant Miller Laboratory Treatability Study Results (Appendix E).
 - Selected locations for pilot tests based on stratigraphy, COI in groundwater, bedrock characterization data, and accessibility.
 - Performed preliminary study of the hydraulics of reagent injections, including sustainable injection rates and distances of treatment solution delivery within the fractured bedrock.

The CCR unit concluded the monitoring period in corrective action and APC has begun implementing the selected groundwater remedies identified in the Groundwater Remedy Selection Report submitted to ADEM in November 2021 and as detailed in the Corrective Action Groundwater Monitoring Program document. The following monitoring-related activities are planned for the CCR unit:

- Conduct the PDI field work to remediate groundwater at two potential remediation areas (PRA) of the Site, to provide data for predictive groundwater modeling and to inform the design of pilot tests beginning in February 2024. The scope of work developed for the PDI includes the following:
 - Update the current Site hydrogeologic conceptual site model (HCSM).
 - Perform surface geophysical survey consisting of Electrical Resistivity Imaging (ERI) and Electrical Self-Potential (SP) methods for identifying the most advantageous locations for borings.
 - Advance two (or more) exploratory borings and collect detailed subsurface data to include lithologic descriptions; soil, groundwater, and rock core sample collection; packer testing; downhole geophysical logging; and lugeon hydraulic conductivity testing.
 - Monitor groundwater elevation response and fluctuations.
 - Determine and implement disposition of each borehole – for example, monitoring well, tracer injection/extraction well, or temporary securement of open borehole at ground surface – to allow for future decisions on permanent borehole disposition.
 - Evaluate the need for permeation grouting and/or geochemical injection test borings and implement as warranted.
- Continue with implementation, evaluation, and reporting of the PDI efforts as part of the Permeation Grouting/Geochemical Injection Pilot Program for the remediation of arsenic, cobalt, lithium, and molybdenum. Following complete evaluation of Site data, a report summarizing the findings and recommended future remedial techniques for the Site will be prepared.
- Conduct the first semi-annual groundwater monitoring event and submit the Semi-Annual Groundwater Monitoring and Corrective Action Report summarizing the findings to ADEM by July 31, 2024.

Pursuant to 40 CFR § 257.90(e)(6), an **Executive Summary Table** has been prepared to describe the status of groundwater monitoring and corrective action during the annual monitoring period for this report.

**Executive Summary Table.
Monitoring Period Summary
Plant Miller - Ash Pond**

Assessment Monitoring Initiated: January 15, 2018

Monitoring Period: January 1 - December 31, 2023

Beginning Status: Corrective Action

Ending Status: Corrective Action

1.0 INTRODUCTION

In accordance with the United States Environmental Protection Agency (EPA) coal combustion residual (CCR) rule (40 CFR Part 257, Subpart D), the State of Alabama Department of Environmental Management (ADEM) Admin. Code Ch. 335-13-15, and ADEM Administrative Order (AO) No. 18-098-GW, this 2023 Annual Groundwater Monitoring and Corrective Action Report has been prepared to document 2023 semi-annual groundwater monitoring activities at the Plant Miller Ash Pond (Site or Ash Pond). Semi-annual monitoring and associated reporting for the Ash Pond is performed in accordance with the monitoring requirements of 40 CFR §§ 257.90 through 257.98 and ADEM Admin. Code r. 335-13-15-.06(1) through r. 335-13-15-.06(9).

Semi-Annual Groundwater Monitoring and Corrective Action Reports include an update on groundwater delineation activities completed since the submittal of the Facility Plan for Groundwater Investigation (November 13, 2018) and corrective action activities completed since the submittal of the Corrective Action Groundwater Monitoring Program (February 28, 2022).

2.0 MONITORING PROGRAM STATUS

The Site is currently in corrective action and implementing groundwater remedies. In accordance with 40 CFR § 257.94(e) and ADEM Admin. Code r. 335-13-15-.06(5)(e), APC implemented assessment monitoring in January 2018. Statistically significant increases (SSI) of Appendix III and statistically significant levels (SSL) of Appendix IV parameters were identified at the Plant Miller Ash Pond during sampling events conducted in 2018. Pursuant to 40 CFR § 257.95(g)(3)(i) and ADEM Admin. Code r. 335-13-15-.06(6)(g)4.(i), APC completed an ACM in accordance with 40 CFR § 257.96, ADEM Admin. Code r. 335-13-15-.06(7), and AO No. 18-098-GW. The ACM was completed June 12, 2019, and a public meeting was held to discuss the ACM on July 7, 2020.

Following the ACM, the Groundwater Remedy Selection Report was prepared and submitted on November 30, 2021, to meet the requirements of 40 CFR § 257.97, ADEM Admin. Code r. 335-13-15-.06(8), and Part C of AO No. 18-098-GW. Subsequently, within 90 days of remedy selection, the Corrective Action Groundwater Monitoring Program was submitted on February 28, 2022.

In accordance with 40 CFR § 257.98 and ADEM Admin. Code r. 335-13-15-.06(9), APC will continue semi-annual groundwater monitoring, including all monitoring wells in the certified groundwater monitoring network and any well installed to characterize the horizontal and vertical extent of SSL. APC will continue with implementation of the groundwater remedies described in the Groundwater Remedy Selection Report and Corrective Action Groundwater Monitoring Program document.

3.0 SITE LOCATION AND DESCRIPTION

The APC James H. Miller, Jr., Electric Generating Plant (Plant Miller) is located at 4250 Porter Road, Quinton, AL 35130-9471. Plant Miller is approximately 15 miles northwest of Birmingham in western Jefferson County, Alabama. The plant occupies Sections 21, 22, 27, 28, 29, 32, 33, and 34, Township 16 South, Range 5 West and Section 4, Township 17 South, Range 5 West. Section/Township/Range data are based on visual inspection of USGS topographic quadrangle maps and GIS plant boundary files provided by Southern Company (USGS, 1982; USGS, 1983). The Ash Pond is located south of the main plant. **Figure 1, Site Location Map**, depicts the location of the Plant and Ash Pond with respect to the surrounding area.

3.1 PHYSICAL SETTING

Plant Miller is located in the Black Warrior River basin, an area typified by moderate relief, with river and stream valleys having dendritic drainage patterns. Elevations at the Site range from approximately 260 feet above mean sea level (MSL) near the Locust Fork to over 550 feet MSL along ridges north and south of the Ash Pond. **Figure 2, Site Topographic Map**, provides the topography of the Site.

3.2 SITE GEOLOGY AND HYDROGEOLOGY

3.2.1 Geology and Hydrogeology

Plant Miller lies in the Warrior Basin physiographic region (Sapp and Emplaincourt, 1975), a late Paleozoic basin formed as a result of flexure and sediment loading associated with Appalachian and Ouachita orogenies. The bedrock geology is dominated by clastic sedimentary rocks of the Upper Pottsville Formation as shown on **Figure 3, Site Geologic Map** (Geologic Survey of Alabama, (GSA), 2010b). This formation is characterized by cyclic sequences (cyclothems) of marginal marine shale/claystone, siltstone, sandstone, conglomerates, and individual coal beds. These depositional cyclothems reflect the sediment balance controlled by 4th or 5th order glacial eustasy, continued basin evolution, and variations in sedimentation rates (Pashin and Raymond, 2004). Deeper stratigraphy is marked by carbonates, shales, chert, and sandstones of Mississippian to Cambrian in age (Raymond et al., 1988).

The Plant Miller Ash Pond is directly underlain by rocks belonging to the Mary Lee, Gillespy, and Pratt Coal Groups (Ward II et al., 1989) of the Upper Pottsville Formation. In general, each coal group consists

of mudstone, shale, fine-grained sandstone, and interbedded coal in fining-upward sequences. Each coal group is bounded by a maximum flooding surface and marine shale unit. Upper Pottsville strata at Plant Miller are on the southeast limb of the Sequatchie Anticline and dip to the southeast between 3° and 5°. **Figures 4A, Geologic Cross-Section A-A'**, through **4E, Geologic Cross-Section E-E'**, illustrate the Pottsville Formation strata underlying the Site.

Bedrock discontinuities measured during geologic mapping and downhole geophysical surveys were statistically analyzed using lower-hemisphere equal-area stereonet to assess dominant orientations for joint sets and bedding. The average bedding from only geologic mapping measurements is 04°, 122° (dip, dip direction) or N32°E dipping 4°SE (quadrant strike/dip).

Up to four different joint sets formed due to tectonic stresses on the bedrock. These joint sets can be classified as dip, strike, or oblique joints. Dip joints form parallel to bedding dip direction and are typically perpendicular to fold axes, representing extension that is perpendicular to the maximum principal stress direction or direction of compression. These joints are commonly near vertical. Strike joints develop parallel to the strike of bedding and fold axes, typically forming from tension along fold hinges. The dip direction and angle of these joints is nearly orthogonal to the dip direction and angle of bedding. Oblique joints commonly develop diagonal ($\pm 30^\circ$) to the principal stress direction and represent conjugate sets formed from shear. An additional joint set is present at the Site that is subparallel to bedding, which is interpreted to represent exfoliation or spheroidal weathering of the rock mass. The most prominent joint sets can be grouped into the following orientations:

- Joint Set 1 (dip joint): 88°, 195°
- Joint Set 2 (strike joint): 90°, 318°
- Joint Set 3: rotated 81°, 221° to 82°, 248°
- Joint Set 4 (subparallel bedding): 06°, 167

The Pottsville aquifer system underlies the Site. The Pottsville aquifer system is composed primarily of Pennsylvanian-age sandstones, shales, conglomerates, and coal. Groundwater flow primarily occurs through coal seams or rock fabric discontinuities such as bedding planes and fractures. Groundwater in the Pottsville aquifer system is commonly regarded as confined due to large permeability contrasts within the aquifer (Stricklin, 1989). Recharge to the Pottsville formation is largely through infiltration of precipitation and to a lesser extent, downward seepage of river water at hydraulically favored locations.

Regionally, recharge is accommodated largely by fracture enhanced permeability. Major recharge zones to the Pottsville Formation are related to major geologic structures such as large fault zones or along systematic fold axes (Pashin, 2007). Although the Pottsville aquifer system is the primary aquifer in Walker County, groundwater use is relatively limited. According to O’Rear et al., 1972, groundwater use accounted for approximately 15% of total water use in Walker County in 1966. By 2005, groundwater use had declined to less than 1% of total water use in Walker County, or 1.14 million gallons per day (mgd) of groundwater out of a total water use of 969.5 mgd (United States Geological Survey (USGS), 2005).

3.2.2 Pottsville Formation – Rock Chemistry

Published data indicate that elevated arsenic concentrations occur in the Southern Appalachian coal strata where Site monitoring wells are screened. Numerous publications document elevated trace metals in Pottsville and Pottsville coal strata (Kolker et al., 1999, Diehl et al., 2004, Goldhaber et al., 2002). For instance, according to the USGS National Coal Data System (NRCDS), the average concentration of arsenic (72 ppm) in the Pottsville coal strata is three times that of the average of other coal basins (Bragg et al., 1997). Of the US coal analyses for arsenic that are at least three standard deviations above the mean, approximately 90% are from the coal fields of Alabama (Diehl et al., 2004). The United States Geological Survey (USGS) maintains an inventory of coal quality that includes trace metal concentration data. It shows an arsenic concentration range of 1.08 mg/kg to 611.0 mg/kg for Walker County coals, with a mean of 47 mg/kg. For Jefferson County, the USGS Coal Quality Database showed an arsenic concentration range of 1.22 mg/kg to 122 mg/kg with a mean of 36 mg/kg in Pratt, Gillespy-Curry, and Mary Lee Coal Groups in the vicinity of Plant Miller.

Similarly, 75 Pratt Coal Group samples (Pratt, Nickel Plate, and American Coal Seams) analyzed by the USGS and inventoried in the USGS National Coal Resource Data System (NRCDS) showed the following ranges of other trace metals:

- Boron – 6.3 to 83.6 ppm (average of 35 ppm).
- Cobalt – 1.6 to 19.8 ppm (average of 8 ppm).
- Molybdenum – 0.8 to 22.2 ppm (average of 5 ppm).
- Lithium – 1.4 to 128 ppm (average of 28 ppm).

Bulk geochemical analyses of Pottsville stratigraphy from Plant Miller were conducted on recovered core. The data reflect arsenic concentrations between 4.4 mg/kg and 64.6 mg/kg in Pottsville core analyzed. Similarly, 21 Pottsville samples collected from the Site provided the following ranges of other trace metals:

- Boron – 10.3 to 92.8 ppm (average of 37 ppm).
- Cobalt – 5.4 to 21.2 ppm (average of 12 ppm).
- Molybdenum – non-detect to 1.9 ppm (average of 0.6 ppm).

Trace metal enrichment and pyrite origins have been linked to post-depositional (post-coalification) deformation and trace metal laden hydrothermal fluids upwelling during Alleghenian tectonism. Diehl et al., (2004) and Goldhaber et al., (2002) describe “high-pyrite” coals as a source of elevated arsenic and other trace metals. In these publications, pyrite occurrence is observed within coal banding, woody cellular fill structures, mineral overgrowths, and structural fills such as veins and microfaults.

Furthermore, the process of strip mining and backfilling these materials can increase the availability of trace metals to groundwater. These mining processes and practices lead to the physical weakening and enhanced weathering of rock, which, along with changed hydrodynamics, can lead to elevated and highly variable concentrations across a historic mine site. This may be evident adjacent to the southeast of the Plant Miller Ash Pond, where, as discussed in **Section 6.3**, lithium concentrations increase significantly in areas of previous strip mining.

3.2.3 Uppermost Aquifer

The Pottsville aquifer is the uppermost aquifer beneath the Site. Groundwater occurs in the Mary Lee, Gillespy, and Pratt Coal Groups of the Upper Pottsville Formation beneath the Site. The Mary Lee Coal Group is the uppermost aquifer north of the Ash Pond, the Gillespy Coal Group and Gillespy-Pratt transition zone are the uppermost aquifers beneath the north-central and western portions of the Ash Pond, and the Pratt Coal Group is the uppermost aquifer beneath the far southeastern portion of the pond.

The primary sources of groundwater in the uppermost aquifer are: (1) coal seams, (2) rock fractures or zones of fracture enhanced permeability, and to a lesser extent (3) bedding plains. Wells were generally screened across coal seams or groundwater yielding fractures. Depth to groundwater-producing zones were highly variable at the Site and generally ranged from 30 to 300 feet below ground surface (BGS).

Based on published data, groundwater quality produced from the Pottsville Formation can be characterized by high concentrations of sulfate, iron, and other trace metals (Jennings and Cook, 2010). Trace metals in Pottsville Formation groundwater are associated with sulfide minerals contained in organic-rich strata (e.g., mudstones and coal seams) and siliceous/carbonate healed fractures and joints. Trace element enrichment is likely the result of migrating hydrothermal fluids generated during the late Paleozoic Allegheny orogeny (Diehl et al., 2005). Arsenic, antimony, molybdenum, selenium, copper, thallium, and mercury are elevated in Warrior Basin coal strata (Goldhaber et al., 2002).

Geochemically, upgradient or natural groundwater types are typically classified as (1) calcium bicarbonate in more shallow systems, (2) sodium chloride in deeper systems, and (3) sodium bicarbonate in intermediate to deep systems where ion exchange is occurring. Together, these would generally fall in the bottom half of Piper or Trilinear diagrams. Exceptions to this can occur in areas of mining – especially strip mining – where groundwater types can often be calcium chloride (upper corner of diamond).

3.2.4 Flow Interpretation

Groundwater flow is accomplished primarily by means of fracture flow, where groundwater flows along more conductive secondary discontinuities in the rock mass such as weaknesses along bedding planes, joints, or cleat fabric in coal seams. Fractures at the Site are typically high-angle/near vertical (80° to 90°). Fracture flow in complex geologic media such as the heterogenous Pottsville Formation can be complex. Groundwater flow in rock aquifer systems is influenced by the structural strike and dip of bedding planes to varying degrees depending on dip magnitude, relative resistance to flow in bed-parallel and cross-bed directions, and orientations to hydraulic gradient. In some cases, groundwater does not flow exactly perpendicular to the head gradients, in a process called flow distortion as illustrated by potentiometric surface contours. In the Plant Miller area, the strike of rock is typically to the northeast and structural dip is most commonly towards the south and southeast with an average dip magnitude of 4 degrees. Some degree of preferential groundwater flow may occur away from the Site in these directions.

Groundwater in the Pottsville aquifer is most commonly regarded as confined due to large permeability contrasts within the aquifer (Stricklin, 1989). The Pottsville at the Site is probably best described as a series of discrete, confined to semi-confined, groundwater yielding zones where groundwater elevations can vary significantly laterally and vertically and are governed by the heterogeneity of the lithology and degree of fracture network interconnectivity.

Potentiometric data suggest the following groundwater flow patterns and characteristics:

Mary Lee Aquifer: (1) North to south to the north of the Plant Miller Ash Pond and (2) stagnant or west to east towards the Ash Pond; groundwater could be flowing towards underground Mary Lee Mine. Likely confined from Ash Pond by 150 to 300 feet of low permeability strata as evidenced by large, vertical hydraulic separation between water elevation in the Ash Pond (~423 feet MSL) and groundwater elevations in the Mary Lee coal (~280 feet MSL).

Gillespy Lower Discrete Interval: South-southeast flow direction; likely discontinuous zone of groundwater flow, especially west of topographic low/valley adjacent to the west of the north-central ash pond area.

Gillespy Lower Sandstone Interval: West to east flow direction; only present in the subsurface from an area beginning just to the north of MR-AP-MW-6V. Potentially confined from Ash Pond as evidenced by groundwater flow direction and large, vertical hydraulic separation between water elevation in the Ash Pond (~423 feet MSL) and groundwater elevations in the flow system (~259 feet NAVD88).

Gillespy-Pratt Transition Zone: Radial flow pattern emanating from east-northeastern portion of ash pond; strongest gradients appear to the southeast and then east towards adjacent Pratt Coal Mine; wells to northeast (saddle dike area) appear lateral (side-gradient) to groundwater flow pattern. Composed of two to three confined to semi-confined discrete flow systems.

Pratt Coal Group: Radial flow pattern emanating from southeastern portion of the ash pond; strongest gradients appear to the southeast and then east towards adjacent Pratt Coal Mine; vertical groundwater separation of three to eight feet generally exists between Pratt and American coal seams (discrete flow zones within Pratt Coal Group). Comprised of two to three confined to semi-confined discrete flow systems.

3.3 GROUNDWATER MONITORING SYSTEM

Pursuant to 40 CFR § 257.91 and ADEM Admin. Code r. 335-13-15-.06(2), Plant Miller has installed a groundwater monitoring network to evaluate groundwater quality within the uppermost aquifer. The certified groundwater monitoring system for the Ash Pond is designed to monitor groundwater passing the waste boundary of the CCR unit.. Wells were sited to serve as upgradient and downgradient monitoring locations based on groundwater flow direction as determined by the potentiometric surface elevation

contour maps. All groundwater monitoring wells were designed and constructed using “Design and Installation of Groundwater Monitoring Wells in Aquifers,” ASTM Subcommittee D18.21, as a guideline.

3.3.1 Monitoring Wells

Well locations at the Site are designated as upgradient, downgradient, piezometer (water-level only), vertical delineation, and horizontal delineation. The following subsections provide a summary of well designations and if applicable, changes or modifications to the well network or designations. As described in the Site Groundwater Monitoring Plan, modifications to the well network or designation must first be approved by ADEM.

The location and designation of Site wells are presented on **Figure 5, Monitoring Well Location Map**.

3.3.1.1 Upgradient Wells

To evaluate upgradient well locations at the Site, groundwater elevations and CCR indicator parameters were reviewed. As described in **Sections 3.2.3 and 3.2.4**, there are multiple groundwater flow regimes within the Pottsville Formation at the Site. Groundwater flow systems, as evaluated by potentiometric data, appear to have radial flow or flow away components away from the Site, and are not suitable for upgradient designations (except for Mary Lee and Lower Gillespy Discrete Zone).

Additionally, the Gillespy-Pratt Transition Zone and Pratt Coal Group, where the majority of downgradient wells are screened, do not exist in the vicinity of the Site (and the majority of the Warrior Basin) due to mining or lithology being absent (strata project above ground surface). Therefore, there is little or perhaps even no opportunity for installing upgradient locations in these areas.

Background groundwater quality data for the monitored formations is provided by wells GS-AP-MW-8, GS-AP-MW-13, and GS-AP-MW-17V installed at the nearby Plant Gorgas Ash Pond. These locations are suitable as upgradient locations due to (1) placement in similar geology and (2) screened intervals at these wells monitor recharging groundwater that has not been impacted by either Site. Well GS-AP-MW-13 is no longer in service and sampled, but the historical background database will continue to be used in background calculations. This well is installed at an elevation above the level of the Gorgas Ash Pond and exhibits a groundwater elevation approximately 30 feet higher than the Plant Gorgas Ash Pond; therefore, this well represents younger groundwater infiltrating the Pottsville and captures the natural geochemical variability within the formation.

Appendix III (detection monitoring parameters) constituent concentrations along with select other Appendix IV CCR indicator parameters were also evaluated as further basis for designating locations GS-AP-MW-8, GS-AP-MW-13, and GS-AP-MW-17V as upgradient. In general, concentrations of CCR indicator parameters reported for these well locations are well below published Groundwater Protection Standards (GWPS), downgradient wells, and pore-water (source) concentrations. The absence of elevated concentrations of CCR indicator parameters indicates younger, recharging groundwater and groundwater that has not been impacted by groundwater flowing away from the Ash Pond. These data, along with groundwater elevation data, support an upgradient designation for locations GS-AP-MW-8, GS-AP-MW-13, and GS-AP-MW-17V. Upgradient location GS-AP-MW-13 was abandoned in 2019. Historical data from this location will still be used for statistical comparison of groundwater quality data. Location GS-AP-MW-17V was originally intended for vertical delineation at the Gorgas Ash Pond but was screened at a higher elevation due to encountering the underlying Maxine Mine at depth and identifying more shallow groundwater flow. These wells provide groundwater quality information from the top of the Pratt Coal Group, although none are installed in coal measures and are likely biased towards lower concentrations of trace metals.

Potential Future Upgradient Well Locations

Six additional upgradient locations closer to the Site have been installed: MR-AP-MW-21 and MR-AP-MW-23 in 2019 and MR-AP-MW-22S, MR-AP-MW-22I, MR-AP-MW-22D, and MR-AP-MW-23A in 2020. These six additional upgradient monitoring wells are located approximately 2 miles WNW of Plant Miller. These locations were chosen based on their similar positions on the Sequatchie Anticline and APC land ownership. These locations sit on the opposite limb of the Sequatchie Anticline, but at similar elevation, structural, and stratigraphic setting.

The additional upgradient wells were installed during Phase I and Phase II delineation activities for further evaluation and comparison with downgradient compliance and delineation wells at the Site. Upgradient location MR-AP-MW-23A was paired with monitor well MR-AP-MW-23 to determine if bentonite seal or grout contamination occurred during the installation of MR-AP-MW-23.

Stratigraphically, these upgradient well locations are screened in middle to lower-middle sections of the Mary Lee Coal Group. Based on the data reviewed, the Mary Lee Coal bed may have existed 60 to 120 feet above ground surface. These wells installed between 47 and 200 feet BGS, should correlate

approximately to the Blue Creek through Jagger Coal horizons. Coal seams are noted at depths of approximately 66 feet BGS, 82 feet BGS, 104 feet BGS, 134 feet BGS, and 195 feet BGS. The most prominent coal seam occurs between 134 feet BGS and 137.5 feet BGS. These wells are deeper and screened across coal seams, and likely, provide more representative concentrations of trace metals, especially in comparison to deep or coal measure screened downgradient wells.

The additional upgradient monitoring wells were sampled for the first time during the April-May 2021 semi-annual monitoring event as part of the semi-annual assessment groundwater monitoring program. It is important to note that these six additional well locations were not included as upgradient locations in the *September 2020 Groundwater Monitoring Plan*. A sufficient data set and full evaluation of that data has been conducted and these wells have been included into the groundwater monitoring network.

Table 1A, Compliance Monitoring Well Network Details, summarizes compliance well installation data including monitoring well construction details and the lithology (flow system) adjacent to the screened interval. Potential future upgradient well locations are listed as such in **Table 1A** and it should be noted that these locations are not being used in statistical analyses.

3.3.1.2 Downgradient Wells

Currently, the groundwater monitoring network comprises 20 downgradient monitoring wells installed along the boundary of the Ash Pond. Ash pond closure activities necessitated the abandonment of nine downgradient compliance locations. Seven of the nine downgradient compliance locations were replaced. The seven replacement wells (MR-AP-MW-7SR, MR-AP-MW-7DR, MR-AP-MW-9SR, MR-AP-MW-9DR, MR-AP-MW-13SR, MR-AP-MW-13DR, and MR-AP-MW-14R) were pre-surveyed in the field, ground elevations were compared between original and replacement well locations, and a target depth for boring was pre-determined based on structural dip and the difference in ground elevation. The new groundwater wells were installed in water bearing zones as close to the wells being replaced as conditions warranted. The new wells were installed as close as feasible to the waste boundary of the CCR unit to (1) provide an accurate representation of the quality of groundwater passing the waste boundary and (2) not interfere with the closure construction activities or final cover system of the Plant Miller Ash Pond.

Borehole geophysics, hydrophysical logging, and occasional packer testing were used to determine well screen intervals. These logging techniques identify groundwater flow zones in open boreholes and are

optimally suited for use in low-yielding, fractured rock media. Heat-pulse flowmeter logging or packer testing were often used to assess or further evaluate flow zones indicated by hydrophysical logging tools. If multiple flow zones were identified, then paired wells were often installed to screen both zones.

Preferential groundwater flow away from the Site, if existing, occurs within zones of enhanced permeability such as cleated coals or zones of intersecting rock discontinuities spatially located lateral to or beneath the base of the Ash Pond. Strata of the Gillespy-Pratt Coal Groups are the uppermost aquifer lateral to or beneath the base of the Ash Pond as indicated by borehole logging and geophysics in central and southern portions of the Site. To the north, Pratt Coal Group strata exist above ground surface or are absent. In these areas, downgradient monitoring well locations were installed across the first groundwater yielding fractures identified by borehole geophysics or within the deeper Mary Lee coal seam.

Monitoring well locations are presented on **Figure 5. Table 1A**, which summarizes compliance well installation data including monitoring well construction details and the lithology (flow system) adjacent to the screened interval.

3.3.1.3 Delineation Wells

Pursuant to 40 CFR § 257.95(g)(1), ADEM Admin. Code r. 335-13-15-.06(6)(g), and AO No. 18-098-GW, additional monitoring wells were installed to characterize the horizontal and vertical extent of GWPS exceedances identified during assessment monitoring. In 2020, two horizontal delineation wells (MR-AP-MW-27HR and MR-AP-MW-36HR) were installed to replace previously installed delineation wells (MR-AP-MW-27H and MR-AP-MW-36H) that did not yield sufficient groundwater for development or sampling, and one previously installed delineation well (MR-AP-MW-31H) was redeveloped and re-designated from a piezometer to a horizontal delineation well. All three wells were sampled for the first time during the second semi-annual sampling event of 2020.

A summary of well installation dates, location, elevation, screen interval, and purpose are provided in **Table 1b, Delineation Well Network Details**, and **Figure 5**.

3.3.1.4 Piezometers

There are currently three water-level only piezometers at the Site (MR-AP-MW-2V, MR-AP-MW-3V, and MR-AP-MW-19H). These locations were originally intended as delineation locations but did not yield sufficient groundwater for development or sampling and were re-designated as piezometers.

Changes to the piezometer network occurred in 2020 as locations MR-AP-MW-27H, MR-AP-MW-29H, MR-AP-MW-31H, and MR-AP-MW-36H were reassessed in a low-yield well study conducted in July 2020. Wells MR-AP-MW-27H and MR-AP-MW-36H were abandoned and replaced, well MR-AP-MW-29H was abandoned, and well MR-AP-MW-31H was successfully redeveloped.

Figure 5 and **Table 1c, Piezometer Well Network Details**, summarize monitoring well construction details and design purpose for the Plant Miller Ash Pond.

3.3.1.5 Monitoring Well Replacement and Abandonment

Ash pond closure activities necessitated the abandonment and relocation of nine downgradient compliance locations. A plan for the abandonment and relocation of the nine monitoring wells (MR-AP-MW-7S, MR-AP-MW-7D, MR-AP-MW-8S, MR-AP-MW-8D, MR-AP-MW-9S, MR-AP-MW-9D, MR-AP-MW-13S, MR-AP-MW-13D, and MR-AP-MW-14) was submitted to ADEM in February 2020 and approved in May 2020. A revised work plan added to the original scope of work to include the abandonment and reinstallation of three previously installed horizontal delineation wells re-designated as piezometers (MR-AP-MW-27H, MR-AP-MW-29H, and MR-AP-MW-36H).

The abandonment of the nine downgradient monitor wells and three horizontal delineation wells re-designated as piezometers occurred between June and August 2020. One replacement horizontal delineation well (MR-AP-MW-29HR) boring was abandoned due to the presence of predominately mine spoils. The monitoring wells and boring were abandoned in accordance with Alabama well construction standards described in Administrative Code Div. 335-13 and the Alabama Environmental Investigation and Remediation Guidance (AEIRG; Revised 2017).

A summary of previous well abandonments is provided in **Table 1d, Abandoned Well Network Details**.

3.3.2 Monitoring Variances

The groundwater monitoring program at the Site is operating under a Variance granted by ADEM on April 15, 2019, to conform State monitoring requirements under the CCR rule to Federal requirements. The variance:

1. Retains boron as an Appendix III detection monitoring parameter and excludes it as an Appendix IV assessment monitoring parameter.

2. Authorizes the use of Federally-published GWPS of 0.006 milligrams per liter (mg/L) for cobalt; 0.015 mg/L for lead; 0.040 mg/L for lithium; and 0.100 mg/L for molybdenum in lieu of background where those levels are greater than background levels.

3.3.3 Groundwater Monitoring History

Background groundwater samples were collected from July 2016 to June 2017. Semi-annual groundwater monitoring was initiated at the Ash Pond in September 2017.

In accordance with 40 CFR § 257.94(b), eight independent samples were collected from each background and downgradient well and analyzed for the constituents listed in Appendix III and IV prior to October 17, 2017. Background sampling was performed over the period of July 2016 to June 2017. Groundwater sampling for the first detection monitoring event after the background period was performed in September 2017.

Based on results of the 2017 Annual Groundwater and Corrective Action Monitoring Report, Alabama Power initiated an assessment monitoring program on January 15, 2018. Pursuant to 40 CFR § 257.95(a) and ADEM Admin. Code r. 335-13-15-.06(6)(a), monitoring wells were sampled for all Appendix IV parameters in February 2018, within 90 days of initiating the assessment monitoring program.

Statistical evaluations of 2018 assessment monitoring data identified SSL of Appendix IV constituents above the GWPS, and the Site entered Assessment of Corrective Measures. Pursuant to 40 CFR § 257.95(g)(1), ADEM Admin. Code r. 335-13-15-.06(6)(g)2., and AO No. 18-098-GW, additional monitoring wells (**Table 1B, Figure 5**) were installed to characterize the horizontal and vertical extent of GWPS exceedances identified during assessment monitoring in two phases of groundwater investigations between January 2019 and September 2020. These wells, along with the compliance monitoring well network, are sampled semi-annually.

Delineation wells installed at the Site have been sampled concurrently with the compliance monitoring well network beginning with the second semi-annual sampling event in 2020. However, occasionally, additional data collection has occurred independent of routine compliance sampling events to support continuing assessment activities at the Site.

3.3.3.1 Available Monitoring Data

Laboratory analytical data is available for the groundwater monitoring history outlined in **Section 3.3.3**. Tabulated results for Appendix III and Appendix IV constituents by monitoring well are included in **Appendix A, Analytical Data Summary**.

3.3.3.2 Historical Groundwater Flow

Historical groundwater elevations and potentiometric surface maps show that groundwater flow patterns are consistent across monitoring events and as described in **Section 3.2.4**. As ash pond closure activities progress over the years and upon completion of closure, groundwater elevations will likely display variability representative of changing Site hydrodynamics and eventually, a new set of equilibrium conditions. As this timeline progresses, groundwater elevations and trends will be qualitatively reviewed against this historical data set.

Tables summarizing groundwater elevations from all groundwater monitoring events are included in **Appendix B, Historical Groundwater Elevations Summary**.

3.4 GROUNDWATER SAMPLING AND ANALYSIS

Site compliance wells are typically sampled semi-annually between: (1) late winter and mid-spring and (2) early to late fall. The spacing between sampling events is sufficient to yield independent groundwater samples and a general representation of the different climatic or meteorological seasons that create a degree of natural variability in groundwater quality.

During routine semi-annual monitoring events, all compliance and delineation network wells are sampled and analyzed for Appendix III and Appendix IV constituents.

The following subsections summarize the sequential steps and process for the sampling, handling and transport, and analysis of compliance-related groundwater samples at the Site.

3.4.1 Groundwater Sample Collection

Prior to recording water levels and collecting samples, each well was opened and allowed to equilibrate to atmospheric pressure. Within a 24-hour period, depths to groundwater were measured to the nearest 0.01 foot with an electronic water level indicator with depth referenced from the top of the inner PVC well

casing. Groundwater elevations were calculated by subtracting the depth to groundwater from surveyed top-of-casing (TOC) elevations.

Groundwater samples were collected from monitoring wells using low-flow sampling procedures in accordance with 40 CFR § 257.93(a) and ADEM Admin. Code r. 335-13-15-.06(4)(a). Non-flowing (artesian) monitoring wells at Plant Miller are equipped with a dedicated pump. Monitoring wells were purged and sampled using low-flow sampling procedures. In this procedure, field water quality parameters (pH, turbidity, conductivity, and dissolved oxygen) are measured to determine stabilization and groundwater samples are collected when the following stabilization criteria are met:

- 0.2 standard units for pH.
- 5% for specific conductance.
- 0.2 Mg/L or 10% for DO > 0.5 mg/l (whichever is greater).
- Turbidity measurements less than 5 nephelometric turbidity units (NTU).
- Temperature and oxidation reduction potential (ORP) – record only, no stabilization criteria.

During purging and sampling, an in situ Aqua TROLL instrument was used to monitor and record field parameters. All downhole groundwater monitoring equipment and instrumentation was calibrated prior to sample collection per the manufacturer's specifications outlined in the Alabama Power Environmental Affairs (EA) Water and Field Group (WFG) Technical Operating Procedure, dated December 14, 2021.

Once stabilization was achieved, samples were collected and submitted to the laboratory following standard chain-of-custody (COC) protocol. Field data recorded in support of groundwater sampling activities are included in **Appendix C, Laboratory and Field Records**.

3.4.2 Sample Preservation and Handling

Groundwater samples were collected in the designated size and type of laboratory-supplied containers required for specific parameters. Sample bottles were pre-preserved by the laboratory.

Where temperature control was required, samples were placed in an ice-packed cooler and cooled to less than 6 °C immediately after collection. Blue ice or other cooling packs were not used for cooling samples. An ice-packed cooler was on hand when samples were collected.

3.4.3 Chain of Custody

A COC record was used to track sample possession from the time of collection to the time of receipt at the laboratory. All samples were handled under strict COC procedures beginning in the field. COC records are included with the analytical laboratory reports included in **Appendix C**.

3.4.4 Laboratory Analysis

Laboratory analyses were performed by the APC Environmental Laboratory (APCEL) in Calera, Alabama and Pace Analytical Services, LLC (Pace) in Greensburg, Pennsylvania. Both APCEL and Pace are accredited by National Environmental Laboratory Accreditation Program (NELAP) and maintain a NELAP certification for all parameters analyzed. **Table 2, Parameters and Reporting Limits**, lists monitoring constituents analyzed from Site groundwater samples. Lab reports and COC records for the monitoring period are presented in **Appendix C**.

3.4.5 Sampling Event Summary

As required by 40 CFR § 257.90(e) and ADEM Admin. Code r. 335-13-15-.06(1)(e), the following describes monitoring-related activities performed during the monitoring period.

The first semi-annual monitoring event occurred between April 18 and May 3, 2023. The second semi-annual monitoring event occurred between September 25 and October 12, 2023. Groundwater samples were analyzed for the full list of Appendix III and Appendix IV parameters during monitoring period sampling events. Additional general chemistry and monitored natural attenuation monitoring parameters are also sampled and analyzed. These analytes have been incorporated for continued evaluations of geochemical facies and their evolution over time. These analytes will also support geochemical modeling and evaluations associated with monitored natural attenuation. These parameters include:

- Calcium (filtered)
- Iron (total and dissolved)
- Silicon (total and dissolved)
- Silica (total and dissolved)
- Sodium (total and dissolved)
- Sulfide

- Potassium
- Aluminum (total and dissolved)
- Manganese
- Magnesium (total and filtered)
- Nitrate-Nitrite
- Total Alkalinity, Carbonate Alkalinity, Bicarbonate Alkalinity
- Total Organic Carbon.

All groundwater sampling activities were conducted by APC Field and Water Services. Pace Analytical Services (Greensburg) performed the laboratory analyses of Radium-226 and Radium-228 (reported combined) as well as the MNA parameter sulfide (Pace – New Orleans). APCEL performed the remaining Appendix III and Appendix IV analyses. Analytical data from the groundwater monitoring events is included as **Appendix C** in accordance with the requirements of 40 CFR § 257.90(e)(3) and ADEM Admin. Code r. 335-13-15-.06(1)(e)3.

4.0 GROUNDWATER ELEVATIONS AND FLOW

During the first semi-annual monitoring event, groundwater elevations ranged from 155.64 to 429.22 feet North American Vertical Datum of 1988 (NAVD88) (with exception of artesian water-level conditions observed at locations MR-AP-MW-5 and MR-AP-PZ-5). Readings and elevations in piezometers MR-AP-MW-2V and MR-AP-MW-19H are not representative of groundwater elevations in Site flow systems. During this monitoring event piezometer MR-AP-MW-2V was not gauged.

The following maps depict groundwater elevations and inferred groundwater flow direction during the first 2023 semi-annual monitoring event: **Figure 6A, Potentiometric Surface Contour Map (April 18, 2023) – Mary Lee Aquifer, Figure 6B, Potentiometric Surface Contour Map (April 18, 2023) – Gillespy Lower Discrete Flow Zone, Figure 6C, Potentiometric Surface Contour Map (April 18, 2023) – Gillespy Lower Sandstone Unit(s), Figure 6D, Potentiometric Surface Contour Map (April 18, 2023) – Gillespy Coal-Pratt Transition Zone, Figure 6E, Potentiometric Surface Contour Map (April 18, 2023) – Pratt Coal Group.**

During the second 2023 semi-annual monitoring event, groundwater elevations ranged from 168.42 to 423.02 feet NAVD88 (with exception of artesian water-level conditions observed at locations MR-AP-MW-5 and MR-AP-PZ-5). The following maps depict groundwater elevations and inferred groundwater flow direction during the second 2023 semi-annual monitoring event: **Figure 7A, Potentiometric Surface Contour Map (September 25, 2023) – Mary Lee Aquifer, Figure 7B, Potentiometric Surface Contour Map (September 25, 2023) – Gillespy Lower Discrete Flow Zone, Figure 7C, Potentiometric Surface Contour Map (September 25, 2023) – Gillespy Lower Sandstone Unit(s), Figure 7D, Potentiometric Surface Contour Map (September 25, 2023) – Gillespy Coal-Pratt Transition Zone, Figure 7E, Potentiometric Surface Contour Map (September 25, 2023) – Pratt Coal Group.**

Potentiometric surface maps for the Site are subdivided into five flow systems based on hydrostratigraphy and vertical separation in groundwater. The Gillespy-Pratt Transition Zone and Pratt Coal Group flow systems have been generalized, as these flow systems are comprised of two to three discrete, sub-flow systems often representing fractures or coal seams separated by confining units. For example, as shown on **Figures 6E and 7E**, the Pratt Group could be further subdivided (vertical separation between MW-9SR/09DR pairs).

These vertical separations in groundwater elevations prominently display the confined to semi-confined conditions described in **Sections 3.2.3 and 3.2.4**. During a detailed review of historical water levels, it was

interpreted that Upper Gillespy and Pratt Transition flow systems can largely be grouped together as one flow system for the purposes of describing groundwater flow.

In general, it is inferred that laterally continuous zones that intersect or have communication with the Ash Pond through interconnected fractures will display radial flow patterns away from the Site and emanate near the stratigraphic intersection with the Ash Pond. Hydrostratigraphic intervals that do not intersect or that have poor to no hydraulic connection with the Ash Pond will display groundwater flow pattern consistent with topography or regional flow patterns. The Gillespy-Pratt Transition Zone, which underlies the largest portion of the pond, exhibits this type of pattern on **Figures 6D and 7D**, as does the Pratt Coal Group on **Figures 6E and 7E**, although true radial flow to the northwest is uncertain in the Pratt Coal Group as these strata daylight to the northwest (proximal to MR-AP-MW-13SR/DR).

As shown on **Figures 6A and 7A**, wells screened within the Mary Lee Coal seam display little hydraulic gradient and groundwater flow towards the Ash Pond and the underground Mary Lee coal mine during the September 2023 groundwater gauging event. As shown on **Figures 6C and 7C**, wells screened within the Gillespy Lower Sandstone show an almost due west to east flow direction, which, combined with the large hydraulic separation between the ash pond and flow system groundwater elevations, indicate no direct hydraulic communication between the two. These are two flow systems that suggest limited or no hydraulic communication with the Plant Miller Ash Pond.

4.1 GROUNDWATER ELEVATION CHANGES

Extensive dewatering has occurred within the Ash Pond as part of the closure process. On April 18, 2023, the average pond elevation was 384.3 feet NAVD88 and down approximately 40 feet from historical operational levels (420 to 423 feet NAVD88). On September 25, 2023, the average pond elevation was 374.2 feet NAVD88 and down approximately 50 feet from historical operational levels. Based on data reviewed, dewatering appears to have driven changes in groundwater elevation and groundwater flow during 2023.

Groundwater elevation data prior to 2020 is used for establishing normal, reference ranges for groundwater elevations and for comparison with most recent groundwater elevations. Wells with sufficient data sets prior to 2020 are limited to compliance wells. Groundwater elevations in multiple well locations during both semi-annual monitoring events were identified as potential lower bound outliers based upon historical groundwater elevation data and screening with Interquartile Range (1.5 x IQR) statistics. These wells demonstrated groundwater elevations significantly lower than expected which implies a correlation or

relationship with lowering pond elevations. During the first semi-annual monitoring event, the following compliance wells exhibited lower bound outlier water elevations:

Well	Lower bound GW Elevation Threshold (IQR)	GW Elevation 4/18/2023	Distance below Lower bound GW Elevation
MR-AP-MW-3S	344.09	340.05	-4.04
MR-AP-MW-3D	323.57	320.24	-3.33
MR-AP-MW-4	380.59	370.50	-10.09
MR-AP-MW-4V	331.81	324.73	-7.08
MR-AP-MW-10	410.19	390.66	-19.53
MR-AP-MW-12	414.94	396.02	-18.95
MR-AP-MW-15	398.94	397.71	-1.23

During the second semi-annual monitoring event, the following compliance wells exhibited lower bound outlier water elevations:

Well	Lower bound GW Elevation Threshold (IQR)	GW Elevation 9/25/2023	Distance below Lower bound GW Elevation
MR-AP-MW-3D	322.72	314.91	-7.81
MR-AP-MW-3S	343.93	336.39	-7.54
MR-AP-MW-4	380.26	363.65	-16.61
MR-AP-MW-4V	324.30	320.19	-4.11
MR-AP-MW-10	409.50	387.03	-22.47
MR-AP-MW-12	414.45	392.32	-22.13
MR-AP-MW-15	397.53	395.35	-2.18
MR-AP-MW-16	385.69	381.57	-4.11

Nine downgradient and delineation wells displayed groundwater elevations above pond elevation (384.03 feet NAVD88 and 374.2 feet NAVD88) on April 18, 2023, and September 25, 2023, respectively. These locations are clustered east and south of the Ash Pond. These data indicate a potential transition in flow direction where: (1) groundwater may flow towards the pond from the east or (2) a no flow boundary develops in the area.

Recent groundwater elevation data recorded since 2016 have been tabulated and included in **Table 3, Groundwater Elevations Summary**. All historical available groundwater data recorded since 2016 have been tabulated and included in **Appendix B**.

4.2 GROUNDWATER FLOW VELOCITY CALCULATIONS

Because the geology at the Ash Pond is not homogeneous or isotropic with respect to groundwater flow, groundwater velocity calculations using derivations of Darcy's Law are not applicable to groundwater at the Site. The hydrogeologic characteristics of fractured rock typically produce preferential groundwater flow paths, so groundwater velocity is much more variable than in uniform porous media such as sand.

During monitoring well installation, multiple techniques were used to successfully intercept groundwater flow paths with the monitoring wells located around the Ash Pond. These flow paths correspond to coal cleats/fractures, zones of fracture concentration, bedding planes, and other discontinuities in the rock. Therefore, groundwater flow velocity at the Site cannot be accurately quantified using existing Site data.

Aquifer performance testing, including slug tests, has been conducted to characterize hydraulic conductivity values at the Site. Slug and packer testing provided horizontal hydraulic conductivities for the uppermost aquifer between 1.00×10^{-3} cm/sec and 6.00×10^{-7} cm/sec. Hydraulic conductivity in the uppermost aquifer typically ranges between 10^{-4} to 10^{-5} cm/sec with an average 6.15×10^{-4} cm/sec.

The lowest estimated hydraulic conductivity value of 6×10^{-7} cm/sec was derived from packer testing performed at borehole MR-AP-MW-3D (interval 170 ft to 226 ft) and borehole MR-AP-MW-4 (interval 80 ft to 137 ft). The measured recovery for these tests was on the order of 1%. This is indicative of a relatively closed system where fractures, if any, are poorly connected to the surrounding groundwater flow system. The complex lithostratigraphy, sharp permeability contrasts, and fractured nature of the Pottsville Formation contribute to vertical groundwater flow at the Site as well as confining to semi-confining conditions evidenced in the spatial distribution of hydraulic heads.

5.0 EVALUATION OF GROUNDWATER QUALITY DATA

5.1 DATA VALIDATION – QUALITY ASSURANCE/QUALITY CONTROL

During each sampling event, quality assurance/quality control samples (QA/QC) were collected at an interval of one sample per group of 10 well locations. Equipment blank and field blank samples were also collected during each sampling event.

Analytical precision is measured through the calculation of the relative percent difference (RPD) of two data sets generated from a similar source. Here, a comparison of results between samples and field duplicate samples are used as measure of laboratory precision. Where field duplicates are collected, the RPD between the sample and duplicate sample is calculated as:

$$RPD = \frac{Conc1 - Conc2}{(Conc1 + Conc2)/2}$$

Where:

RPD = Relative Percent Difference (%)

Conc1 = Higher concentration of the sample or field duplicate

Conc2 = Lower concentration of the sample or field duplicate

Where the relative percent differences below 20%, the difference is considered acceptable, and no further action is needed. Where an RPD is greater than 20%, further evaluation is required to attempt to determine the cause of the difference and potentially result in qualified data. **Table 4a, Relative Percent Difference (RPD) Calculations**, provides the relative percent differences for sample and sample duplicates during the annual monitoring period.

During the first 2023 semi-annual sampling event, with the exception of arsenic in wells MR-AP-MW-22S and MR-AP-MW-20HS, all RPDs were below 20%. Because (1) neither result is greater than 5 times the RL (0.0002) and (2) the difference between the original and duplicate result is less than the RL, no data validation flags are applied. All RPDs were below 20% during the second 2023 semi-annual sampling event.

Low-level (trace) detections of chromium and barium were observed in blank samples. **Table 4b – Field QC: Blank Detections**, provides a summary of these detected results. Each of these blank detections was an estimated concentration, above the MDL but below the RL, and qualified in the laboratory analytical reports with “J flags. If blank concentrations are detected above the MDL in field QC samples, all original results less than five times the field QC detection are flagged with a (+) U* and MDL/RL values are modified. The results of the above data validation procedures do not impact Site statistical analyses due to the low-level concentrations and constituents detected.

5.2 STATISTICAL METHODOLOGY AND TESTS

The Sanitas Groundwater statistical software is used to perform the statistical analyses. Sanitas is a decision support software package that incorporates the statistical tests required of Subtitle C and D facilities by EPA regulations. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015) as well as with the USEPA Unified Guidance (2009).

5.2.1 Appendix III Evaluation

Intrawell prediction limits, combined with a 1-of-2 verification strategy, are used for pH to determine whether there has been SSI over background groundwater quality. Interwell prediction limits, combined with a 1-of-2 verification strategy, are used to evaluate boron, calcium, chloride, fluoride, sulfate, and TDS. Intrawell prediction limits use screened historical data within a given well to establish limits for parameters at that well. The most recent sample from the same well is compared to its respective background to identify SSI over background. Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The most recent sample from each downgradient well is compared to the background limit to identify SSI.

Groundwater Stats Consulting demonstrated that these test methods were appropriate in the October 2017 Statistical Analysis Plan, which was updated in August 2020 with additional data screening and evaluation. Time series plots were used to screen proposed background data for suspected outliers, or extreme values that would result in limits that are not conservative from a regulatory perspective. Suspected outliers at all wells for Appendix III parameters are formally tested using Tukey’s box plot method and, when identified, flagged in the computer database.

The following adjustments are also part of the statistical analysis:

- No statistical analyses are required on wells and analytes containing 100% non-detects (EPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects in the background, simple substitution of one-half the reporting limit is used in the statistical analysis. The reporting limit used for non-detects is the practical quantitation limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects the Kaplan-Meier non-detect adjustment is applied to the background data.

5.2.2 Appendix IV Evaluation

When in corrective action, Appendix IV constituents are sampled semi-annually, and concentrations are compared to GWPS. Following the Unified Guidance, spatial variation for Appendix III parameters is tested using the ANOVA; this test is not prescribed for Appendix IV constituents. Unlike the statistical evaluation of Appendix III constituents (where single-sample results are compared to the statistical limit), Appendix IV analysis uses the pooled results from each downgradient well to develop a well-specific Confidence Interval that is compared to the statistical limit. The statistical limit is either the Interwell Tolerance limit (i.e., background) calculated using the pool of all available upgradient well data (see Chapter 7 of the Unified Guidance), or an applicable groundwater protection standard such as the MCL. Appendix IV background data are screened for outliers and extreme trending patterns that would lead to artificially elevated statistical limits.

Parametric tolerance limits (UTL) were calculated using pooled upgradient well data for Appendix IV parameters with a target of 95% confidence and 95% coverage. The confidence and coverage levels for nonparametric tolerance limits are dependent on the number of background samples. The UTLs were then used as the GWPS.

As described in 40 CFR §§ 257.95(h)(1)-(3) and the ADEM Variance (see **Section 3.3.2**), the GWPS is:

- (1) The maximum contaminant level (MCL) established under 40 CFR §§ 141.62 and 141.66.
- (2) Where an MCL has not been established:
 - (i) Cobalt 0.006 mg/l.
 - (ii) Lead 0.015 mg/l.
 - (iii) Lithium 0.040 mg/l.
 - (iv) Molybdenum 0.100 mg/l.

- (3) Background levels for constituents where the background level is higher than the MCL or rule specified GWPS.

In corrective action, when the Lower Confidence Limit (LCL), or the entire interval, exceeds the GWPS as discussed in the USEPA Unified Guidance (2009), the result is recorded as an SSL. Appendix IV constituents will be updated every 2 years initiating with the Fall 2019 event. The latest update to GWPS occurred Fall of 2023 with the succeeding update scheduled for Fall 2025. Data from upgradient wells collected between updates may still be used to support ASDs, if merited.

5.3 STATISTICAL EXCEEDANCES

Analytical data from the first and second 2023 semi-annual monitoring events were statistically analyzed in accordance with the Professional Engineer (PE)-certified Statistical Analysis Plan (October 2017) and revised in August 2020 by Groundwater Stats Consulting. Appendix III statistical analysis was performed to determine if constituents have returned to background levels. Appendix IV monitoring parameters were evaluated to determine if concentrations statistically exceeded the established groundwater protection standard.

5.3.1 Appendix III Constituents

Based on review of the Appendix III statistical analysis presented in **Appendix D, Statistical Analyses**, Appendix III constituents have not returned to background levels.

5.3.2 Appendix IV Constituents

Table 5, Summary of Background Levels and Groundwater Protection Standards, summarizes the background limit established at each monitoring well and the GWPS. A summary table of the statistical limits accompanies the prediction limits in **Appendix D**. Site GWPS were updated after the Fall 2023 sampling event. The following subsections describe statistical exceedances reported during the 2023 annual monitoring period.

Comparison with Published GWPS

For this comparison, variance limits for non-MCL constituents are used, and data from newly installed upgradient wells were not factored in.

5.3.2.1 First Semi-Annual Groundwater Monitoring Event

Statistical analysis of Appendix IV data incorporating limits defined in the 2019 ADEM Variance (**Section 3.3.2**) identified the following SSL over GWPS at the listed wells during the first semi-annual monitoring event of 2023:

- MR-AP-MW-1: Lithium.
- MR-AP-MW-2: Cobalt, Lithium.
- MR-AP-MW-3D: Lithium, Arsenic
- MR-AP-MW-3S: Lithium.
- MR-AP-MW-4: Lithium.
- MR-AP-MW-5: Lithium.
- MR-AP-MW-6: Lithium.
- MR-AP-MW-7SR: Lithium.
- MR-AP-MW-7DR: Lithium.
- MR-AP-MW-9DR: Lithium.
- MR-AP-MW-10: Lithium, Molybdenum.
- MR-AP-MW-11: Lithium.
- MR-AP-MW-12: Lithium, Molybdenum.
- MR-AP-PZ-5: Lithium.
- MR-AP-MW-13SR: Cobalt.
- MR-AP-MW-16: Lithium

Delineation Wells

Limited groundwater analytical data is available for delineation wells installed at the Site; therefore, groundwater quality is simply compared to the GWPS. Similar to above, this comparison includes variance limits for non-MCL constituents and does not include Site-specific background derived GWPS. A review of analytical data derived from delineation wells revealed the following GWPS exceedances for the first 2023 semi-annual sampling event:

- MR-AP-MW-4V: Lithium
- MR-AP-MW-6V: Lithium.
- MR-AP-MW-17H: Lithium.
- MR-AP-MW-18H: Lithium.
- MR-AP-MW-19HA: Lithium.
- MR-AP-MW-20H: Lithium.
- MR-AP-MW-20HS: Lithium.
- MR-AP-MW-27HR: Lithium
- MR-AP-MW-28H: Lithium.
- MR-AP-MW-30H: Lithium.
- MR-AP-MW-31H: Lithium
- MR-AP-MW-33H: Lithium, Cobalt.
- MR-AP-MW-34H: Lithium.
- MR-AP-MW-35H: Arsenic.
- MR-AP-MW-36HR: Lithium.
- MR-AP-MW-37H: Lithium.

Details regarding the installation and sampling of these wells, and future proposed actions as a result of these exceedances, were submitted to ADEM in a delineation report on May 13, 2019, and subsequent progress updates submitted in September 2019 and March 2020.

Comparison with Site Background - Lithium

During the first semi-annual monitoring event, Appendix IV data were compared to background concentrations from newly installed upgradient well GS-AP-MW-17V. The primary difference is the increase in the lithium GWPS from 0.04 to 0.0809 mg/L. For this comparison, only lithium exceedances are noted.

Using concentrations from MR-AP-MW-17V as a guide for Site-specific background concentrations, the following concentrations were identified over GWPS at the listed downgradient wells:

- MR-AP-MW-1: Lithium.
- MR-AP-MW-2: Lithium.
- MR-AP-MW-3D: Lithium.
- MR-AP-MW-3S: Lithium.
- MR-AP-MW-5: Lithium.
- MR-AP-MW-7SR: Lithium.
- MR-AP-MW-7DR: Lithium.
- MR-AP-MW-10: Lithium.
- MR-AP-MW-11: Lithium.
- MR-AP-PZ-5: Lithium.

The increased GWPS (from 0.04 to 0.0809 mg/L) reduces the number of lithium exceedances from 15 to 10.

Delineation Wells

The same comparison is made with Site delineation wells. A review of analytical data derived from delineation wells revealed the following GWPS exceedances for the first semi-annual sampling event:

- MR-AP-MW-6V: Lithium.
- MR-AP-MW-18H: Lithium.
- MR-AP-MW-19HA: Lithium.
- MR-AP-MW-20H: Lithium.
- MR-AP-MW-30H: Lithium.
- MR-AP-MW-31H: Lithium.
- MR-AP-MW-33H: Lithium.
- MR-AP-MW-34H: Lithium.
- MR-AP-MW-36HR: Lithium.

The increased GWPS (from 0.04 to 0.0809 mg/L) reduces the number of lithium exceedances from 15 to 9.

Table 6, First Semi-Annual Monitoring Event Analytical Results Summary, provides a summary of all detected constituents for the first 2023 semi-annual sampling event. Statistical reporting output is included as **Appendix D**.

5.3.2.2 Second Semi-Annual Monitoring Event

During the second semi-annual monitoring event, statistical analysis of Appendix IV data incorporating limits defined in the 2019 ADEM Variance (**Section 3.3.2**) identified the following SSL over GWPS at the listed downgradient wells:

- MR-AP-MW-1: Lithium.
- MR-AP-MW-2: Cobalt, Lithium.
- MR-AP-MW-3D: Lithium, Arsenic
- MR-AP-MW-3S: Lithium.
- MR-AP-MW-4: Lithium.
- MR-AP-MW-5: Lithium.
- MR-AP-MW-6: Lithium.
- MR-AP-MW-7SR: Lithium.
- MR-AP-MW-7DR: Lithium.
- MR-AP-MW-9SR: Lithium.
- MR-AP-MW-9DR: Lithium.
- MR-AP-MW-10: Lithium, Molybdenum.
- MR-AP-MW-11: Lithium.
- MR-AP-MW-12: Lithium, Molybdenum.
- MR-AP-PZ-5: Lithium.
- MR-AP-MW-13SR: Cobalt.
- MR-AP-MW-16: Lithium

Statistical analysis of Appendix IV concentrations over GWPS from monitoring well MR-AP-MW-9SR identified lithium as an SSL for the first time during the second 2023 semi-annual sampling event.

Delineation Wells

Limited groundwater analytical data is available for delineation wells installed at the Site; therefore, groundwater quality is simply compared to the GWPS. Similar to above, this comparison includes variance limits for non-MCL constituents and does not include Site-specific background derived GWPS. A review of analytical data derived from delineation wells revealed the following GWPS exceedances for the second semi-annual sampling event:

- MR-AP-MW-6V: Lithium.
- MR-AP-MW-17H: Lithium.
- MR-AP-MW-18H: Lithium.
- MR-AP-MW-19HA: Lithium.
- MR-AP-MW-20H: Lithium.
- MR-AP-MW-27HR: Lithium
- MR-AP-MW-28H: Lithium.
- MR-AP-MW-30H: Lithium.
- MR-AP-MW-31H: Lithium
- MR-AP-MW-33H: Lithium, Cobalt.
- MR-AP-MW-34H: Lithium.
- MR-AP-MW-35H: Arsenic.
- MR-AP-MW-36HR: Lithium, Molybdenum.
- MR-AP-MW-37H: Lithium.

Details regarding the installation and sampling of these wells, and future proposed actions as a result of these exceedances, were submitted to ADEM in a delineation report on May 13, 2019, and subsequent progress updates submitted in September 2019 and March 2020.

Comparison with Site Background - Lithium

During the second semi-annual monitoring event, Appendix IV data were compared to background concentrations from newly installed upgradient well GS-AP-MW-17V. The primary difference is the increase in the lithium GWPS from 0.04 to 0.0809 mg/L. For this comparison, only lithium exceedances are noted.

Using concentrations from MR-AP-MW-17V as a guide for Site-specific background concentrations, the following concentrations were identified over GWPS at the listed downgradient wells:

- MR-AP-MW-1: Lithium.
- MR-AP-MW-2: Lithium.
- MR-AP-MW-3D: Lithium.
- MR-AP-MW-3S: Lithium.
- MR-AP-MW-5: Lithium.
- MR-AP-MW-7SR: Lithium.
- MR-AP-MW-7DR: Lithium.
- MR-AP-MW-10: Lithium.
- MR-AP-MW-11: Lithium.
- MR-AP-PZ-5: Lithium.

The increased GWPS (from 0.04 to 0.0809 mg/L) reduces the number of lithium exceedances from 17 to 10.

Delineation Wells

The same comparison is made with Site delineation wells. A review of analytical data derived from delineation wells revealed the following GWPS exceedances for the second semi-annual sampling event:

- MR-AP-MW-17H: Lithium.
- MR-AP-MW-18H: Lithium.
- MR-AP-MW-19HA: Lithium.
- MR-AP-MW-20H: Lithium.

- MR-AP-MW-30H: Lithium.
- MR-AP-MW-31H: Lithium.
- MR-AP-MW-33H: Lithium.
- MR-AP-MW-34H: Lithium.
- MR-AP-MW-36HR: Lithium.

The increased GWPS (from 0.04 to 0.0809 mg/L) reduces the number of lithium exceedances from 13 to 9.

Table 7, Second Semi-Annual Monitoring Event Analytical Results Summary, provides a summary of all detected constituents for the second 2023 semi-annual sampling event. Statistical reporting output is included as **Appendix D**.

6.0 GROUNDWATER ASSESSMENT AND CORRECTIVE ACTION

As required by Part E of the Order (AO 18-098-GW) and correspondence from ADEM (March 2021), this report provides an update on groundwater delineation activities completed since the submittal of the Facility Plan for Groundwater Investigation (November 13, 2018). The primary purpose of this plan and subsequent phases of work is to identify the horizontal and vertical extent of groundwater impacts defined by EPA Appendix IV groundwater protection standards.

A comprehensive groundwater delineation report summarizing findings was submitted to ADEM in September 2020. The conclusions and results presented indicate that groundwater delineation has been completed to a sufficient degree to define spatial extent of groundwater impacts and to inform a groundwater remedy selection plan.

6.1 CHRONOLOGY OF DELINEATION ACTIVITIES

Beginning in 2019, Semi-Annual Progress Reports were routinely provided to ADEM in March and September. Alabama Power Company (APC) requested approval to combine information typically provided in the Semi-Annual Progress Reports with Semi-Annual Groundwater Monitoring and Corrective Action Reports on March 15, 2021. ADEM approved this approach and revised timeline for submittals on March 16, 2021. APC now provides ADEM with a discussion of delineation results and activities in each semi-annual groundwater monitoring and corrective action report until released in writing.

6.1.1 Delineation Wells

Part B of the Order required the installation of additional wells as necessary to define the extent of groundwater impacts. The following sections describe monitoring wells installed to delineate impacts to groundwater.

Phase I – Groundwater Investigation (January 2019 – August 2019)

Phase I was conducted between January 14, 2019, and August 15, 2019. **Tables 1a** through **1c** and **Figure 5** present details and locations of delineation wells. The following summarizes all activities that were completed during Phase I of groundwater delineation at the Site:

- Installed four horizontal delineation wells (MR-AP-MW17H, MR-AP-MW-18H, MR-AP-MW-20H, and MR-AP-MW-20HS), two vertical delineation wells (MR-AP-MW-4V and MR-AP-MW-6V), and three ash pond piezometers (MR-AP-MW-2V, MR-AP-MW-3V, and MR-AP-MW-19H) between January 14, 2019, and February 23, 2019. Additionally, a characterization well (MR-AP-MW-21) was

installed approximately 2 miles west-northwest of Plant Miller to assess the viability of using the well for background groundwater quality. The location was chosen based on its similar position on the Sequatchie Anticline and APC land ownership. This area is on the opposite limb of the Sequatchie Anticline, but at similar elevation, structural, and stratigraphic setting.

- Developed delineation wells between February 1, 2019, and March 3, 2019. Vertical delineation wells MW-2V and MW-3V and horizontal delineation well MW-19H did not yield sufficient water for well development or sampling and were designated as water level only piezometers.
- Sampled the newly installed wells that were successfully developed on March 5, 2019, and March 6, 2019.
- Submitted a Groundwater Investigation Report to ADEM on May 13, 2019. This report recommended a second phase of groundwater investigation to complete delineation of groundwater impacts as required by Part B of the Order and included a well installation plan to install additional upgradient monitor wells in the area of the previously successfully installed monitor well MR-AP-MW-21. The installation of the proposed additional upgradient locations was approved in July 2019 by ADEM.
- Submitted an Assessment of Corrective Measures to ADEM on July 11, 2019, as required by Part C of the Order.
- Submitted a Phase II – Groundwater Delineation Plan to ADEM on August 15, 2019. This plan documented planned activities associated with proposed Phase II delineation efforts.
- On December 30, 2019, provided ADEM with a response to comments received from ADEM on November 14, 2019.

Phase II – Groundwater Investigation (November 2019 – September 2020)

Following a review of data gathered from the Phase I Investigation, additional groundwater investigation was proposed to ADEM in a Phase II Delineation Plan submitted August 15, 2019, to further delineate extent of groundwater impacts. Additionally, ash pond closure activities necessitated the abandonment and relocation of nine downgradient compliance locations. A plan for the abandonment and relocation of the nine monitoring wells was submitted to ADEM in February 2020 and approved in May 2020. **Tables 1a through 1c** and **Figure 5** present details and locations of Phase II delineation well activities conducted between November 20, 2019, and March 10, 2020.

Phase II abandonment, replacement, and additional upgradient activities conducted between June 16, 2020, and September 25, 2020, were ongoing and at the time of this report.

The following summarizes all activities that were completed during Phase II of groundwater delineation at the Site:

- Installed twelve horizontal delineation wells (MR-AP-MW-19HA, MR-AP-MW-27H, MR-AP-MW-28H, MR-AP-MW-29H, MR-AP-MW-30H, MR-AP-MW-31H, MR-AP-MW-32H, MR-AP-MW-33H, MR-AP-MW-34H, MR-AP-MW-35H, MR-A-MW-36H, and MR-AP-MW-37H) and one additional upgradient well (MR-AP-MW-23) between November 20, 2019 and January 7, 2020.
- Developed the delineation wells and upgradient well between December 16, 2019, and February 24, 2020. Horizontal delineation wells MR-AP-MW-27H, MR-AP-MW-29H, MR-AP-MW-31H, and MR-AP-MW-36H did not yield sufficient water for well development or sampling and were designated as water-level-only piezometers.
- Sampled the newly installed wells that were successfully developed during semi-annual assessment monitoring between March 2, 2020, and March 12, 2020.
- Submitted a Groundwater Monitoring Well Installation and Abandonment Request February 19, 2020, and revised April 22, 2020, that was approved by ADEM May 4, 2020. A revised work plan added to the original scope of work to include the abandonment and reinstallation of three previously installed horizontal delineation wells re-designated as piezometers (MR-AP-MW27H, MR-AP-MW-29H, and MR-AP-MW-36H) and the installation of one additional upgradient well location (MR-AP-MW-22). Additionally, the plan included a reduction of the number of relocation monitoring wells from nine to seven.
- Abandoned nine downgradient monitor wells (MR-AP-MW-7S, MR-AP-MW-7D, MR-AP-MW-8S, MR-AP-MW-8D, MR-AP-MW-9S, MR-AP-MW-9D, MR-AP-MW-13S, MR-AP-MW-13D, and MR-AP-MW-14) due to ash pond closure activities on June 16, 2020, and June 17, 2020.
- Installed replacement downgradient monitor wells (MR-AP-MW-7SR, MR-AP-MW-7DR, MR-AP-MW-9SR, MR-AP-MW-9DR, MR-AP-MW-13SR, MR-AP-MW-13DR, and MR-AP-MW-14R) between June 29, 2020, and July 15, 2020.
- Abandoned previously installed unsuccessful horizontal delineation wells (MR-AP-MW27H, MR-AP-MW-29H, and MR-AP-MW-36H) between August 9, 2020, and August 22, 2020, and installed replacement wells (MR-AP-MW27HR and MR-AP-MW-36HR) on August 9, 2020. The replacement horizontal delineation well (MR-AP-MW-29HR) boring was abandoned August 5, 2020, due to the presence of predominately mine spoils.

- Installed four additional upgradient monitor wells (MR-AP-MW-23A, MR-AP-MW-22S, MR-AP-MW-22I, and MR-AP-MW-22D) approximately 2 miles west-northwest of Plant Miller between August 18, 2020, and September 2, 2020.
- Surveyed replacement well and additional upgradient wells between September 23, 2020, and September 25, 2020.

6.2 NATURE AND QUANTITY OF RELEASE

Part B of the Order also required collecting data on the nature and estimated quantity of material released. To collect data regarding the nature of the source and estimated quantity of material released, sampling of ash pore-water at three locations was conducted. Ash pore-water was sampled for all EPA Appendix III and IV constituents. Groundwater quality data is compared to source water and leachate composition to provide a basis for evaluating the degree to which the source area has contributed to constituents to groundwater.

6.3 DELINEATION RESULTS

Groundwater Monitoring and Corrective Action reports for the Plant Miller Ash Pond have identified SSL in groundwater for arsenic, cobalt, lithium, and molybdenum. Isoconcentration maps are presented in **Figures 8A** through **12B**, respectively.

The displayed Isoconcentration lines shown on **Figures 8A** through **12B** are data-driven contours derived from the spatial distribution of constituent concentrations in the well network. When spatially distributed objects are spatially correlated (i.e., objects close to together have similar characteristics) interpolation analysis can be used to predict “unknowns” between objects. ArcGIS and geostatistical analyst are used to interpolate chemical concentrations between well locations. This process involves the transformation of chemical concentration data to log-normal distribution prior to interpolation. In cases where concentrations decrease below the GWPS between well pairs, the extent of groundwater impacts is interpreted from the interpolated (predicted) data set. This method considers the spatial pattern of decreasing concentrations observed in nearby wells. Additionally, when applicable, isoconcentration maps have been subdivided by major flow system.

The location and spacing of delineation wells are largely based upon the following goals and Site factors:

1. Determine if impacts to groundwater could extend off-Site in the direction of groundwater flow away from the facility.
2. Evaluate potential for vertical migration adjacent to compliance wells with SSL and within the context of Site hydrogeology.
3. Address key data gaps between phases, working in from property line or off-Site depending on gaps.
4. Ability to safely access locations with drill rig and supporting equipment.
5. Occurrence of groundwater and sufficient groundwater yield/recharge at locations.
6. Delineate extent of impacts and capture additional hydrogeologic data necessary to evaluate the feasibility of groundwater remediation technologies.

As shown on **Table 1B**, 17 delineation wells have been installed at the Site to assess potential impacts. Additionally, three delineation wells were installed but did not produce sufficient groundwater yield to sample (**Table 1C**).

A geogenic study to evaluate natural sources of arsenic, cobalt, lithium, and molybdenum began in the fall of 2022 and is currently ongoing. This study is a continuation of previous data evaluations that have

included boron isotopic analyses, tritium analyses, desktop studies on Pottsville rock chemistry, and additional background water quality analyses. These data have provided strong signals of geogenic sources of constituents of interest (COI) in many wells and areas of the Site. Upon completion of the geogenic study, a report documenting findings and recommendations will be submitted to ADEM. These recommendations could include additional groundwater assessment in areas of the Site described in this section.

The geology, hydrostratigraphy, and geochemical variability (including potential natural sources of trace metals) beneath Plant Miller is incredibly complex. The following discussion provides the most comprehensive discussion of hydrostratigraphy and results to date. **Section 6.4** provides a recommended path forward.

Arsenic Delineation

Arsenic mobilization and concentrations are significantly influenced by pH (between 6.5 and 8.5) and by redox conditions (range between 50 and -150 mV). This geochemical behavior can result in variations over time driven by changes in pH and ORP.

At the Site, arsenic has historically exceeded the GWPS at compliance wells MR-AP-MW-3D and MR-AP-MW-5, and more recently, delineation well MR-AP-MW-35H and compliance well MR-AP-MW-10. **Figure 8A, Arsenic Isoconcentration Map (April to May 2023)**, and **Figure 8B, Arsenic Isoconcentration Map (September to October 2023)**, show the locations and extent of arsenic concentrations over the GWPS during the first and second semi-annual monitoring events. Currently, arsenic in well MR-AP-MW-3D is the only SSL according to the most recent statistical analyses report (**Appendix D**). Figures were not subdivided by flow system because arsenic exceedances are so limited. The following paragraphs provide recent details and findings related to arsenic concentrations.

Mary Lee – Gillespy Transition Zone

Following the March 2022 sampling event, statistical analyses indicated that arsenic was no longer an SSL in well MR-AP-MW-3D. However, an increase in arsenic during the September 2022 sampling event resulted in the re-occurrence of an SSL and it has since remained above the GWPS.

Proximal to MR-AP-MW-3D, (1) the shallow, paired well MR-AP-MW-3S has never exceeded the GWPS for arsenic (range of non-detect to 0.0026 mg/L) and (2) a deeper focused vertical delineation well, MR-AP-MW-3V, drilled to a terminal depth of 225 feet and logged with geophysical and hydrophysical

methods, did not encounter a deeper interval of groundwater production. MR-AP-MW-3V was installed approximately 55 feet deeper than MR-AP-MW-3D and screened 10 to 20 feet above the Mary Lee Coal seam, but as indicated by logging, was not a productive well. These data show that groundwater flow in this area is likely preferential and limited to the bedding plane parallel fractures screened by wells MR-AP-MW-3S and MR-AP-MW-3D. Given the lack of groundwater production below the MR-AP-MW-3D screen interval, and the discrete nature of this flow interval, no additional vertical delineation has been recommended.

To the west of MR-AP-MW-3D, there is a steep slope down to a narrow valley, which is bordered to its west by a steep slope upward to a north-south trending ridge. These sharp changes in topography prevent horizontal delineation from occurring at a close spacing to MR-AP-MW-3D. As a result, MR-AP-MW-18H was installed on the opposite ridgeline for purposes of groundwater delineation west of MR-AP-MW-3D. The geophysical log obtained from MR-AP-MW-18H identified the equivalent stratigraphic interval screened by MR-AP-MW-3D. However, hydrophysical logging did not provide strong indications of groundwater flow or yield coming from it, and the well was ultimately installed deeper within an alternating mudstone, sandstone sequence within the Mary Lee Coal Group (~ 50 to 60 feet above the Mary Lee coal). To date, analytical results from MR-AP-MW-18H have shown arsenic to be well below GWPS.

Gillespy Lower Discrete Flow Interval

During the March 2022 sampling event, the arsenic concentration in well MR-AP-MW-5 decreased below the GWPS with a concentration of 0.00987 mg/L. Arsenic concentrations have continued to decline since March 2022 and remain below GWPS. The deeper paired location MR-AP-PZ-5 has been sampled 21 times with no arsenic exceedances observed. All 21 arsenic samples have been non-detect or low-level estimated concentrations.

Mary Lee Coal Group

As shown on **Figures 8A** and **8B**, arsenic exceeds GWPS at delineation well MR-AP-MW-35H. However, the arsenic exceedance at this location does not appear to be an impact from the facility and no further delineation is being proposed in this area. The rationales are:

- (1) Groundwater flow direction is generally towards the Ash Pond and Locust Fork, indicating a hydraulic connection does not exist between the well and ash pond (**Figures 6A** and **7A**).
- (2) Arsenic has not been detected above the GWPS in wells between MR-AP-MW-35H and the ash pond or generally along the northern and northwestern boundaries (**Figures 8A** and **8B**).

- (3) Arsenic has not been detected above the GWPS in Mary Lee Coal Group wells (**Figures 8A and 8B**).
- (4) Low boron concentrations.
- (5) Different geochemical facies than ash pond pore-water samples.
- (6) Groundwater elevations not responsive to ash pond dewatering.

No additional delineation is proposed or recommended in this area.

Pratt Coal Group

Arsenic concentrations in well MR-AP-MW-10 increased significantly during 2022 but have not yet been observed as an SSL. Prior to 2022, arsenic concentrations were “J-flagged” 15 out of 18 times and demonstrated a low concentration range between 0.001 and 0.003 mg/L. A 30-ft decrease in groundwater elevation was noted over 2022 along with increasing conductivity, sodium, sulfate, boron, and TDS. A significant DO spike was observed during the March 2022 monitoring event as well. This well appears to be in a state of change or disequilibrium.

Since the concentration spike in March 2022, arsenic concentrations have decline from 0.061 mg/L to 0.024 mg/L and 0.027 mg/L in May and October 2023 respectively. If arsenic concentrations remain elevated and trigger an SSL, additional field studies may be necessary.

Lithium Delineation

As presented in **Section 5.3.2**, lithium exceedances downgradient of the Plant Miller Ash Pond are the most numerous. Lithium concentrations have been observed above 0.04 mg/L in 44 active or historical wells, which represent 85% of wells sampled. Included in these numbers are six background locations. **Figures 9A, Lithium Concentration Call-Out Map (April to May 2023)**, and **10A, Lithium Concentration Call-Out Map (September to October 2023)**, provide lithium concentrations observed during the first and second semi-annual monitoring events. Data presented on **Figures 9A and 10A** suggest that lithium increases with distance away from the facility as well as with increasing depth, indicating a natural component of lithium.

Background piezometers, installed to the northwest of the ash pond and on the opposite side of the Locust Fork, have been sampled and analyzed for Appendix III and Appendix IV constituents to ascertain groundwater quality in the Pottsville. Additionally, upgradient wells at Plant Gorgas facilities can be used to further evaluate groundwater quality and variability in the Pottsville. A review of these data suggests that

background lithium concentrations are quite commonly elevated in respect to 0.04 mg/L and display naturally variability.

Table 8, Pottsville Background – Lithium and Boron Concentrations, provides background lithium and boron concentration ranges in groundwater by well and by coal group. As presented in this table, lithium concentrations range from 0.0252 to 1.17 mg/L in the lower Mary Lee Coal Group, ND to 0.1030 mg/L in the Upper Pratt Coal Group, and 0.0241 to 0.419 in the Pratt Coal Group + Mine Backfill category. Eight of the 13 wells had the lowest concentrations above the lithium GWPS (0.04 mg/L). The following discussion examines lithium concentrations and is broken down by flow system.

Mary Lee Flow System (Lowermost Flow System)

Figure 9B, Mary Lee Aquifer – Lithium Isoconcentration Map (April to May 2023), and **Figure 10B, Mary Lee Aquifer – Lithium Isoconcentration Map (September to October 2023)**, present lithium concentrations from the first and second sampling events in the Mary Lee Flow System.

As shown on **Figures 6A and 7A**, wells screened within the Mary Lee Coal seam display little hydraulic gradient and groundwater flow towards the Ash Pond and the underground Mary Lee coal mine during the September 2023 groundwater gauging event.

This is the result of a hydraulic connection with the underground Mary Lee mine (Porter Mine), which may have a constant head near 280 feet MSL. Groundwater elevations in Mary Lee wells demonstrate a vertical hydraulic separation of approximately 123 feet from the historic operating levels within the ash pond (423 to 280 feet NAVD88) and are physically separated by 150 to 300 feet of Pottsville strata. Given the (1) lack of hydraulic gradient away from the ash pond, (2) large, vertical hydraulic separation indicative of confining conditions, and (3) great thickness of low permeability materials in between the ash pond and the Mary Lee Flow System, it does not appear the Mary Lee Flow System is a pathway for contaminant migration or is hydraulically connected to the ash pond.

Nine of 13 Mary Lee coal samples viewed from the USGS COALQUAL database exceeded the lithium crustal average of 20 ppm, and typically ranged from 30 to 45 ppm, providing a documented natural source of lithium. Lithium concentrations in the Mary Lee flow system during the most recent sampling event ranged from 0.0298 to 0.2680 mg/L. Boron concentrations ranged from 0.0653 to 0.2710 mg/L. These results are similar to upgradient piezometers screened in the Mary Lee Coal Group presented in **Table 8** where lithium concentrations have ranged from 0.0252 to 1.20 mg/L (averaging – 0.482 mg/L) and boron concentrations have ranged from 0.0619 to 0.779 mg/L (averaging – 0.338 mg/L).

Geochemically, Piper diagrams show that four of the five wells screened across the Mary Lee coal are in geochemical facies indicative of deep, old groundwater. Two wells (MR-AP-MW-19HA and MR-AP-PZ-5) plot in the bottom quadrant of the diamond, which represents a sodium bicarbonate water type. Sodium bicarbonate water types are typical of deep groundwater that is influenced by ion-exchange processes. Two wells (MR-AP-MW-1 and MR-AP-MW-34HA) plot in the right quadrant of the diamond, which represents a sodium chloride water type. Sodium chloride water types are typical of marine and deep, ancient groundwater. This Piper and geochemical facies analyses correlate well with Site hydrogeologic and geologic data and further suggest that the Mary Lee is not a potential pathway for COI migration.

The sample from MR-AP-MW-2 plotted in the upper quadrant indicates a calcium chloride water type. This water type does match the typical water type of CCR pore water, and further geochemical analyses will be conducted to explore potential sources of elevated lithium in MR-AP-MW-2. However, boron isotopic analyses, boron to lithium ratios, and lack of groundwater elevation response to ash pond dewatering strongly suggest a natural or mine-aided source of lithium in well MR-AP-MW-2. Tritium age dating suggests potential groundwater ages of 1958 to 1961 or 1967 to 1971, which pre-date the ash pond (1978).

No additional delineation is recommended in the vicinity of wells MR-AP-MW-1, MR-AP-MW-2, MR-AP-PZ-5, MR-AP-MW-19HA, and MR-AP-MW-34H due to hydrogeologic and geochemical data discussed above.

Mary Lee – Gillespy Transition

Monitoring wells MR-AP-MW-3S and MR-AP-MW-3D occupy discrete groundwater yielding intervals between the Mary Lee coal seam (75 to 110 ft above) and the Gillespy Lower Discrete Flow Zone (40 to 60 ft below) not readily observed in wells to the south or west (perhaps in geophysical log for MR-AP-PZ-5 at depth of ~100 ft BGS). For the purpose of this discussion, we will label this discrete flow zone the Mary Lee to Gillespy Transition Zone although it likely represents the basal flow interval of the Gillespy Coal Group.

MR-AP-MW-3S has exhibited decreasing trends for lithium and boron since the May 2021 sampling event. This follows an increasing trend that began in 2018. Data analyses suggest a strong possibility that MR-AP-MW-3S has a natural or geogenic source of lithium. The rationales for this classification are: boron isotopic analyses, boron to lithium ratios, and geochemical facies indicative of older or different water from pore-water.

MR-AP-MW-3D, installed 30 feet deeper, has demonstrated downward trends for lithium and boron since the September 2021 sampling event. These paired well locations demonstrate confined conditions between

the screened intervals, as groundwater elevations in MR-AP-MW-3S typically range from 347 to 350 feet NAVD88 and groundwater elevations in MR-AP-MW-3D typically range from 325 to 330 feet NAVD88. During most monitoring events, groundwater elevations demonstrate a hydraulic separation between 19 and 21 feet.

MR-AP-MW-3V, drilled to a terminal depth of 225 feet and logged with geophysical and hydrophysical methods, did not encounter a deeper interval of groundwater production. MR-AP-MW-3V was installed approximately 55 feet deeper than MR-AP-MW-3D and screened 10 to 20 feet above the Mary Lee Coal seam, but as indicated by logging, was not a productive well. These data show groundwater flow in this area is likely preferential and limited to the bedding plane parallel fractures screened by wells MR-AP-MW-3S and MR-AP-MW-3D. Given the lack of groundwater production below the MR-AP-MW-3D screen interval, and the discrete nature of this flow interval, no additional vertical delineation has been recommended. Furthermore, as previously discussed with arsenic delineation results, the Mary Lee coal, which would be the next (deeper) flow system encountered, does not appear hydraulically connected to the ash pond.

To the west of MR-AP-MW-3D, there is a steep slope down to a narrow valley, which is bordered to its west by a steep slope upward to a north-south trending ridge. These sharp changes in topography prevent horizontal delineation from occurring at a close spacing to MR-AP-MW-3D. As a result, MR-AP-MW-18H, was installed on the opposite ridgeline for purposes of groundwater delineation west of MR-AP-MW-3D. The geophysical log obtained from MR-AP-MW-18H identified the equivalent stratigraphic interval screened by MR-AP-MW-3D, but hydrophysical logging did not provide strong indications of groundwater flow or yield coming from it. The well was ultimately installed deeper within an alternating mudstone, sandstone sequence within the Mary Lee Coal Group (~ 50 to 60 feet above the Mary Lee coal).

Stratigraphically, the screened interval of MR-AP-MW-18 is approximately 30 feet lower than the screened interval of MR-AP-MW-3D. To date, analytical results from MR-AP-MW-18H have shown seasonality, where lithium concentrations typically demonstrate lower concentrations in the late winter and spring (0.0875 to 0.167 mg/L) and higher concentrations in the late summer and early fall (0.154 to 0.230 mg/L). This further supports seasonally driven concentration patterns. This pattern is not observed in wells MR-AP-MW-3S, MR-AP-MW-3D, or any other well nearby, and perhaps suggests an alternative source of lithium.

Piper diagrams further suggest an alternate source by showing that MR-AP-MW-18H has a sodium chloride water type, which is indicative of deep, ancient groundwater and different than the calcium chloride water type typical of CCR leachates.

Gillespy – Lower Discrete Flow Zone

Figure 9C, Gillespy Lower Discrete Flow Zone – Lithium Isoconcentration Map (April to May 2023), and Figure 10C, Gillespy Lower Discrete Flow Zone – Lithium Isoconcentration Map (September to October 2023), present lithium concentrations observed in this discrete flow zone, which resides approximately 150 to 160 feet above the base of the Mary Lee coal seam. As shown on **Figure 9C**, lithium concentrations ranged from 0.0415 to 0.274 mg/L. Lithium concentrations from the April to May 2023 sampling event were near the GWPS at locations MR-AP-MW-4V and MR-AP-MW-20HS but were much higher in locations MR-AP-MW-33H, MR-AP-MW-5, and MR-AP-MW-7SR.

Historically, MR-AP-MW-4V, located proximal to the ash pond, had demonstrated fluctuating lithium concentrations below or just above the GWPS and therefore, provided northern delineation. However, in March 2022, lithium concentrations increased to 0.12 mg/L and then in September 2022 to 0.155 mg/L. Multiple parameters demonstrated an increase between April 2021 and September 2022. However, concentrations decreased sharply during sampling on May 2, 2023, with lithium concentrations observed at 0.0434 mg/L. Delineation well MR-AP-MW-4V did not produce sufficient water for sampling during the September to October 2023 sampling event. As discussed in Section 4.1, some Site wells have demonstrated groundwater elevations significantly lower than expected which implies a correlation or relationship with lowering pond elevations. The groundwater elevation in vertical delineation well MR-AP-MW-4V has decreased 16.41 feet from September 2021 (336.60 feet NAVD88) to September 2023 (320.19 feet NAVD88).

To the south, the pattern of increased concentrations may have been related to: (1) location of dam providing higher driving force (gradients) for preferential flow, (2) increased hydraulic communication via vertical fractures, or (3) increasing contributions of alternative or natural sources of lithium along the flow path.

Gillespy – Lower Sandstone Interval

Figure 9D, Gillespy Lower Sandstone Unit(s) – Lithium Isoconcentration Map (April 2023), and Figure 10D, Gillespy Lower Sandstone Unit(s) – Lithium Isoconcentration Map (September to October 2023), present lithium concentrations observed in this discrete flow zone, which resides approximately 60 to 70 feet above the Gillespy Lower Discrete Flow Zone (presented in **Figure 9C and 10C**) and approximately 250 feet above the base of the Mary Lee coal (presented in **Figure 9B and 10B**).

Due to the limited spatial occurrence (interval would daylight to the north between MR-AP-MW-4/4V and MR-AP-MW-6/6V), only four wells are installed across this interval. Lithium concentrations ranged from non-detect to 0.212 mg/L in this flow zone during the April-May 2023 sampling event and from non-detect to 0.214 mg/L during the September-October 2023 sampling event.

Groundwater elevations in this flow interval are unique, because (1) hydraulic gradients are minimal, (2) groundwater elevations indicate no connection with the ash pond (historic pond elevation = 423 feet NAVD88 vs interval groundwater elevation = ~259 feet NAVD88), and (3) groundwater flow direction is nearly due east with no apparent components of radial flow or influence from the ash pond. Furthermore, it appears there is a small upward vertical gradient from the Gillespy Lower Discrete Flow Zone towards the Lower Sandstone Interval, although more data are needed to confirm.

As shown on **Figures 9D and 10D**, the Lower Sandstone Interval is delineated to the south by well MR-AP-MW-32H. Additional evaluation of this flow interval may be conducted pending results and recommendations from the Geogenic Study.

Gillespy – Upper Sandstone Interval

Figure 9E, Gillespy Coal – Pratt Transition Zone – Lithium Isoconcentration Map (April to May 2023) and Figure 10E, Gillespy Coal – Pratt Transition Zone – Lithium Isoconcentration Map (September to October 2023), present lithium concentrations observed in this zone, which resides approximately 25 to 70 feet above the Gillespy Lower Sandstone Interval (presented in **Figures 9D and 10D**).

The lower screened intervals of this zone, captured by well MR-AP-MW-27HR, are likely discrete intervals confined from wells installed higher stratigraphically. It is important to note that this zone is not present in the subsurface west of MR-AP-MW-4, MR-AP-MW-6, and MR-AP-MW-7S due to lower topography. Similarly, this zone will not be present in the subsurface north of MR-AP-MW-4 and from a point about 200-300 feet north of MR-AP-MW-16 due to structural dip and topography (daylights north of these areas – above ground surface or not present). These areas to the west and north have already been addressed by discussion of deeper flow systems.

As shown on **Figures 9E and 10E**, lithium concentrations increase in the general direction of groundwater flow to the southeast. Lithium concentrations increase significantly under the southeastern portion of the Site that was previously strip-mined down to the American Coal (lowermost major coal of the Pratt Group). Based on this information, additional delineation in this flow system would have to occur further southeast, which is also the location of a Pratt Group coal mine. Proposing delineation within the footprint of a strip

mine is dubious because wells would likely not provide representative groundwater quality and could introduce additional sources of lithium, such as coal storage, weathered mine backfill, and mine impoundments. A single, additional delineation well southeast of MR-AP-MW-7SR could be installed for additional coverage near the property line. However, this area of the Site is adjacent to the Pratt Coal Group mine as noted above.

To the north, lithium concentrations are above the GWPS in well MR-AP-MW-16 and had been observed as an SSL for the first time during the April-May 2023 sampling event and again in the September-October 2023 sampling event. Additional evaluation and delineation near MR-AP-MW-16 may be conducted pending results and recommendations from the Geogenic Study.

Pratt Group

Figure 9F, Pratt Coal Group – Lithium Isoconcentration Map (April to May 2023) and **Figure 10F, Pratt Coal Group – Lithium Isoconcentration Map (September to October 2023)**, presents lithium concentrations observed in Pratt Coal Group strata. The Pratt Coal Group only underlies the extreme southeastern portion of the Site and was extensively strip mined directly adjacent to the ash pond. Strip mining generally occurred to the east of a line drawn from MR-AP-MW-7SR/DR to MR-AP-MW-13SR/DR. Wells installed at the Site to monitor the Pratt Coal Group largely avoided mine backfill material but are installed lateral to this backfilled strip mine.

Similar to lithium concentrations in the Gillespy-Pratt transition zone (**Figures 9E and 10E**), lithium concentrations increase significantly beneath portions of the Site previously strip mined. It is likely that historical strip mining and weathered backfilled materials contribute to the elevated lithium in these areas.

Additional delineation would typically be proposed to the southeast. However, as mentioned above, the adjacent properties to the southeast are all strip mines where the Pratt Group has been or is in the process of being removed. Aerial imagery indicates that, most, if not all, Pratt Group strata have been removed southeast of the ash pond. Further southeast and adjacent to these mines is a coalbed methane degasification field.

No additional horizontal delineation is feasible to the southeast in the Pratt Coal Group flow system. Boron isotope sampling and analyses are recommended in select wells in this flow system to determine for CCR signatures. The notable increases in lithium concentrations underlying strip mined areas combined with relatively lower boron concentrations could indicate an alternative source for some of these wells.

Cobalt Delineation

Cobalt mobilization and concentrations are significantly influenced by pH (below 6 to 6.25 SU), organic matter in aquifer materials, and by redox conditions (positive ORP conditions). This geochemical behavior can result in variations over time driven by changes in pH and ORP.

Figure 11A, Cobalt Isoconcentration Map (April to May 2023), and Figure 11B, Cobalt Isoconcentration Map (September to October 2023), show cobalt concentrations at the Site. Historically, cobalt has demonstrated GWPS exceedances at locations MR-AP-MW-2, MR-AP-MW-4, MR-AP-MW-6, and MR-AP-MW-13S/13SR. Cobalt concentrations in compliance wells MR-AP-MW-4 and MR-AP-MW-6 have been steadily decreasing over time. Neither of these wells was observed as an SSL during the most recent sampling. Cobalt concentrations increased to slightly above the GWPS at well MR-AP-MW-6 during the 2023 sampling events. Cobalt concentrations in monitor well MR-AP-MW-4 have decreased to below GWPS for the last four sampling events.

During the most recent event, cobalt concentrations were observed above the GWPS in MR-AP-MW-2, MR-AP-MW-6, MR-AP-MW-13SR, MR-AP-MW-15, and MR-AP-MW-33H. The following paragraphs provide recent details and findings related to cobalt concentrations.

Vertical delineation wells MR-AP-MW-2V, MR-AP-MW-4V, and MR-AP-MW-6V were installed to assess deeper groundwater quality. Additionally, data from compliance well MR-AP-MW-13DR can be used for vertical delineation of cobalt at well MR-AP-MW-13SR.

Well MR-AP-MW-4V has shown a cobalt concentration range between 0.002 and 0.013 mg/L with an average concentration of 0.007 mg/L. The April-May 2023 sampling event resulted in a cobalt concentration below the GWPS, and recent sampling events show a downward trend. Cobalt concentrations in both MR-AP-MW-4 and MR-AP-MW-4V were below GWPS during the April-May 2023 sampling event. Cobalt concentrations in MR-AP-MW-4 were below GWPS during the September-October 2023 sampling event. As previously discussed, vertical delineation well MR-AP-MW-4V did not produce sufficient water for sampling during the September-October 2023 sampling event.

Well MR-AP-MW-6V has been sampled 11 times and has never exceeded the GWPS for cobalt. Cobalt has been non-detect in five of these sampling events and displays an average concentration of 0.0002 mg/L. Well MR-AP-MW-6 has shown a significant decrease in cobalt concentrations since 2018 and 2019 sampling events and has been at or below GWPS concentrations during five of the most recent six sampling events increasing to slightly above GWPS during the most recent sampling events. Currently, cobalt concentrations in well MR-AP-MW-6 are not present at statistically significant levels.

MR-AP-MW-33H, located between and to the west of MR-AP-MW-4/4V and MR-AP-MW-6V, did show cobalt concentrations above the GWPS during the April-May 2023 and September-October 2023 sampling events. Cobalt concentrations at this location have been steadily decreasing since September 2021 and have fallen from 0.0123 to 0.0072 mg/L.

Cobalt concentrations in well MR-AP-MW-13SR have continued to exceed the GWPS. Cobalt concentrations and increases observed in this well appear driven by decreasing trend in pH and a general increase in DO and ORP. As previously described, these conditions serve to mobilize cobalt. It is noteworthy that well MR-AP-MW-13SR, has (1) a groundwater elevation higher than the ash pond levels, indicating upgradient water quality, and (2) lacks elevated concentrations of boron and lithium. This could support a link to a naturally occurring source of cobalt. Mobilization of cobalt in well MR-AP-MW-13SR appears related to greater meteoric influence (lower pH, higher DO) in upgradient water as closure activities continue to progress at the Site. Deeper into the Pottsville Formation, Well MR-AP-MW-13DR has been sampled seven times and has never exceeded the GWPS for cobalt. Cobalt displays a concentration range between non-detect and 0.0010 mg/L.

The cobalt exceedance in well MR-AP-MW-2 is considered vertically delineated because the attempted vertical delineation well MR-AP-MW-2V did not yield sufficient groundwater for development or sampling. As described in the lithium delineation discussion, Site geologic and hydrogeologic data are showing that the Mary Lee coal is an unlikely flow path for COI away from the ash pond. This is due to significant hydraulic separation, thickness of low permeability Pottsville separating the base of the pond from the Mary Lee, lack of apparent flow gradients away from the ash pond, and geochemical fingerprinting.

The cobalt concentration in well MR-AP-MW-15 (0.025 mg/L) exceeded GWPS for the first time during the September 2022 sampling event. During the April-May 2023 sampling event, cobalt concentrations decreased to 0.012 mg/L and increased to 0.032 mg/L during the September-October 2023. Increasing cobalt concentrations correlate with decreasing pH and increasing DO during the September-October 2023 sampling event. Historically, cobalt has been non-detect or detected only at trace concentrations in 15 of 21 sampling events. Since cobalt concentrations have only recently been observed above the GWPS, it has not been evaluated as an SSL by statistical methods. Cobalt concentrations and other indicators will be monitored over subsequent events to determine if further delineation and assessment is needed in this area of the Site.

Laterally, cobalt is to delineated (1) to the west by MR-AP-MW-17H, MR-AP-MW-34H, MR-AP-MW-19HA, MR-AP-MW-20H, MR-AP-MW-20HS, MR-AP-MW-32H, MR-AP-MW-7SR, and MR-AP-MW-

7DR, (2) to the north by MR-AP-MW-35H, and (3) to the east by MR-AP-MW-37H, MR-AP-MW-27HR, and MR-AP-MW-28H. The cobalt exceedance at delineation well MR-AP-MW-33H is delineated to the south by MR-AP-MW-5, southwest by well MR-AP-MW-19HA, and northeast by well MR-AP-MW-4V.

Molybdenum Delineation

Molybdenum was observed as an SSL for the first time during the first semi-annual monitoring period of 2022 in wells MR-AP-MW-10 and MR-AP-MW-12. Existing delineation wells downgradient to the east and south of these locations have not exhibited molybdenum concentrations over the GWPS. Monitor wells MR-AP-MW-5 and MR-AP-MW-36HR exhibited molybdenum concentrations above GWPS for the first time during the September-October 2023 sampling event. Delineation and assessment may be proposed following the conclusion of the geogenic source evaluation study. Molybdenum concentrations are presented on **Figure 12A, Molybdenum Isoconcentration Map (April to May 2023)**, and **Figure 12B, Molybdenum Isoconcentration Map (September to October 2023)**.

6.4 STATUS OF DELINEATION

A detailed review of historical geochemical and Site data conducted during the first and second 2023 semi-annual monitoring periods provided strong indications of alternative sources of COI and highlighted the need for additional background locations to capture and quantify lithium concentrations closer to the ash pond area.

Prior to completing additional assessment and delineation activities, the following tasks are recommended to better inform decision making on these types of activities:

- 1) Installation and sampling of additional background wells in the vicinity of the plant proper.
- 2) Perform geogenic source study to further evaluate natural or alternative sources of COI.
- 3) Complete additional pore-water and source characterization sampling.

The geogenic study will be an extensive and technically robust investigation into sources of COI. This study will include total COI concentrations in geologic materials along groundwater flow paths, COI associations with minerals and mineralogical assemblages, and the ability of COI to mobilize into groundwater. This study will continue the evaluation of geochemistry including geochemical facies comparisons and specialized isotopes. The study will look at groundwater elevations, stratigraphy, and flow paths to further evaluate hydraulic connections of deeper flow systems (Mary Lee and Gillespy-Lower Discrete Zone). In general, the study will closely resemble the methods described below.

Upon completion of these tasks, a formal recommendation or plan of action will be submitted to ADEM. This recommendation will address natural sources of COI as well as evaluate the ash pond as a source. This comparison will highlight potential data gaps, assessment needs, and determine if additional delineation is needed and to what extent.

6.5 GROUNDWATER REMEDY AND CORRECTIVE ACTION

An Assessment of Corrective Measures (ACM) for groundwater impacts was conducted and formally submitted to ADEM in June 2019. Additional data analyses and investigations conducted since the ACM culminated with a more detailed Groundwater Remedy Selection Report, submitted in November 2021, and a Corrective Action Groundwater Monitoring Program document submitted in February 2022.

Submittal	Submittal Date	Purpose
Assessment of Corrective Measures	06/2019	Initial evaluation of the feasibility, performance, and implementation of known and emerging groundwater remediation technologies against Site conditions and factors.
Groundwater Remedy Selection Report	11/2021	Formal selection and detailed description of groundwater remedies selected for implementation at the Site.
Corrective Action Groundwater Monitoring Program	02/2022	Plan document to describe process and program for implementation and monitoring of groundwater remedies selected at the Site.

6.5.1 Groundwater Remedy Selection

The Groundwater Remedy Selection Report described the selected remedies for groundwater corrective actions at the Site:

- Source control to include dewatering, consolidation, and capping of the CCR unit,
- Permeation grouting in areas of higher concentrations of COI and preferential groundwater flow pathways to prevent COI movement,
- Monitored natural attenuation (MNA) over the entire Site.

Additionally, it was determined that geochemical manipulation should be included as an alternate or companion remedy selection with permeation grouting. Geochemical manipulation using injection removes COI from groundwater and immobilizes them in situ through the creation of solid precipitates formed from injection of treatment solutions. A Laboratory Treatability Study Results report for the Plant Miller Ash Pond is included as **Appendix E**.

Closure of the CCR Unit, including dewatering, consolidation, and capping, will greatly reduce or eliminate source contributions to groundwater. Permeation grouting was selected because, as a corollary to barrier walls, it impedes groundwater flow and helps prevent the migration of COI away from the source area.

Permeation grouting can be viewed as a complementary method to MNA, where either the sealing of groundwater flow or the slowing of the flow path away from the source area provides longer residence time for MNA processes to reduce COI concentrations. MNA was selected based on the evidence gathered during initial investigations, which highlighted that these processes are already occurring.

6.5.2 Corrective Action – Groundwater Monitoring Program

The Corrective Action Groundwater Monitoring Program describes early plans for implementation and monitoring of groundwater remedies described above. This plan divided the program into two stages.

- Stage 1 will include ongoing compliance monitoring, remedial effectiveness monitoring for permeation grouting, MNA performance monitoring, sentinel and clean-line monitoring (including surface water monitoring), and demonstration that Site conditions remain protective of potential human and ecological receptors. Prompt action will be taken should data or data trends indicate such actions are warranted.
- Stage 2 monitoring will be implemented upon Site closure, with the first 2 years of Stage 2 monitoring consisting of background data collection to serve as a baseline. Stage 2 monitoring will be composed of ongoing compliance monitoring, additional wells or sampling locations as needed to evaluate remedy effectiveness, additional MNA parameters as needed, mass and mass flux calculations, additional monitoring associated with permeation grouting (if implemented), re-evaluation of natural attenuation processes and efficacy every 10 years, and demonstration that Site conditions remain protective of potential human and ecological receptors.

Stage 1

The initial phase of Stage 1 has implementation tasks associated with each selected groundwater remedy that serve as a foundation for the remainder of Stage 1 and Stage 2:

Selected Remedy	Implementation Task(s)
Monitored Natural Attenuation	<ol style="list-style-type: none">1. Implementation of expanded MNA sampling parameters.2. Further assessment of MNA monitoring network.

Selected Remedy	Implementation Task(s)
Permeation Grouting/Geochemical Injection Program	<ol style="list-style-type: none"> 1. Work Scope development and field program for the detailed characterization of fracture flow characteristics and data needs supporting a permeation grouting pilot. 2. Implementation of Permeation Grouting and/or Geochemical Injection Pilot Program using data collected from detailed characterization.
Source Control/Closure Activities	<ol style="list-style-type: none"> 1. Evaluation of geochemical changes in groundwater with respect to transient closure activities such as excavation and dewatering. 2. Implementation of field data collection instruments/telemetry within key monitoring wells to further understand the nature of geochemical changes over time and with respect to closure activities and MNA/geochemical modelling.

Implementation of Monitored Natural Attenuation

MNA sampling parameters were added to the sampling plans and analyzed in the laboratory during the April-May and September-October 2023 sampling events (**Tables 6 and 7**). These parameters, in addition to field parameters, Appendix III parameters, and Appendix IV parameters, are used to study the processes that govern or facilitate MNA and changes in geochemical conditions. Parameters will be included in the Site geochemical model. Enhanced MNA or geochemical manipulation is currently being evaluated for areas of the Site.

Based on continued data evaluation for delineation and assessment of potential geogenic sources of COI, additional assessment wells may be recommended as detailed in **Section 6.4**.

Source Control and Closure Activities

The primary tasks and objectives at the onset of Stage 1 include: (1) monitoring and reviewing for changes in geochemical conditions that would invoke an adaptive trigger, (2) studying transient changes in groundwater quality that could be the result of physical closure activities, and (3) determination of primary mechanisms and geochemical relationships at play in changing geochemical conditions. The understanding of mechanisms and relationships leading to geochemical changes in groundwater provides opportunity to

further understand natural MNA processes at the Site and document the benefits and impacts of source control as closure progresses.

As a part of the Semi-Annual Monitoring Reporting process, groundwater quality is being evaluated with respect to:

- Concentration Trends.
 - By Analyte.
 - By Locations.
 - In Aggregate.
- Geochemical Correlations.
- Concentration Trends and Geochemical Correlations cross-referenced to by recent or active ash pond closure activities.

To facilitate further understanding of trends and correlating relationships, Aqua TROLL instrumentation is being installed at select key monitoring well locations for the near continuous monitoring of field parameters. These additional data will allow for a better understanding of the degree of changes driven by different types of closure activities, the response of Site flow systems, and possible correlations and changes noted in semi-annual monitoring data.

Aqua TROLL instrumentation has been installed at the following monitoring locations:

- MR-AP-MW-1
- MR-AP-MW-3S
- MR-AP-MW-3D
- MR-AP-MW-6
- MR-AP-MW-6V
- MR-AP-MW-12
- MR-AP-MW-13SR
- MR-AP-MW-16
- MR-AP-MW-33H.

Permeation Grouting and/or Geochemical Injection Program

An Implementation and Data Requirements Pre-Design Investigation Plan for a permeation grouting and/or geochemical injection pilot program is being drafted to outline means and methods for the complete geologic and hydrogeologic characterization of the area of the Site selected for the pilot study. This

document provides a plan for the detailed characterization of fracture flow through the Pottsville Formation, including standards for core logging, downhole geophysical methods, hydrogeophysical methods, and aquifer performance testing. This plan will be executed in the field and data analyzed to complete the initial study or foundation phase of the Permeation Grouting/Geochemical Injection Pilot Program.

6.5.3 Pre-Design Investigation

The objective of the pre-design investigation (PDI) is to provide data specific to the potential remediation areas (PRA) to enable predictive groundwater modeling and to inform the design of a permeation grouting and/or geochemical injection pilot test. The determination of the PRA of interest was based in part on results of a surface geophysics survey (electrical resistivity imaging (ERI) and the self-potential (SP) method) that was performed in January 2024. Additionally, each PRA was assessed based on the nature and extent of Site COI concentrations, spatial distribution, drilling accessibility, etc. The most advantageous locations for this investigation include: (1) MR-AP-MW-3D and (2) MR-AP-MW-16. The investigation will further define the understanding of certain subsurface lithologic/hydrogeologic data to include:

- Bedrock fracture data
 - Fracture orientations
 - Fracture apertures and spacings
- Hydraulic data
 - Bulk hydraulic conductivity
 - Hydraulic responses between wells
- Groundwater transport continuity between wells
 - Proof of flow path continuity between and among wells
- Aquifer characteristics
 - Mineralogy and geochemical properties of fracture surfaces
 - Mineralogy and geochemical and physical properties of unfractured rock matrix
- Groundwater characteristics
 - COI concentrations
 - Groundwater geochemical properties

The overall scope of work (SOW) developed for this PDI proposed the following tasks:

- Update the hydrogeologic conceptual site model (HCSM).

- Perform a surface geophysical survey consisting of ERI and SP methods for identifying the most appropriate location for advancing borings.
- Monitor fluctuations in groundwater elevations.
- Advance an estimated two exploratory boreholes to targeted depths (with additional borings to be performed, if appropriate).
- Collect detailed borehole data, including the following:
 - Core descriptions and sample collection.
 - Packer testing (hydraulic testing and groundwater sampling via extraction of groundwater from packer-isolated bedrock intervals).
 - Downhole geophysical logging, to include conventional tools and potentially, an optical/acoustic borehole televiewer, a heat pulse flowmeter (HPFM), cross-borehole resistivity, and nuclear magnetic resonance (NMR; only in existing monitoring wells).
 - Lugeon hydraulic conductivity testing.
- Determine and implement disposition of each borehole – for example, monitoring well, tracer injection/extraction well, or temporary securement of open borehole at ground surface to allow for future decisions on permanent borehole disposition.
- Evaluate the need for tracer testing and implement as warranted.
- Evaluate the need for permeation grout test borings and implement as warranted.
- Evaluate the need for geochemical injection/manipulation test borings and implement as warranted.

Following complete evaluation of Site data collected during the PDI, a report summarizing the findings and recommended future remedial techniques for the Site will be prepared and submitted.

7.0 SUMMARY AND CONCLUSIONS

The first 2023 semi-annual monitoring activities took place from April 18 to May 3, 2023, and the second 2023 semi-annual monitoring activities took place from September 25 to October 12, 2023. Statistical evaluations of the first and second 2023 semi-annual monitoring data identified SSL of Appendix IV constituents above the GWPS. To address previously identified SSL, a Groundwater Remedy Selection Report was prepared and submitted to ADEM on November 30, 2021, and a Corrective Action Groundwater Monitoring Program plan on February 28, 2022. Focused efforts at the Site are now shifted towards planning and implementation of the PDI, pilot testing, and selected remedies along with continued evaluation of assessment and compliance data.

The following future actions will be taken or are recommended for the Site:

- Conduct the PDI field work to remediate groundwater at two potential remediation areas (PRA) of the Site, to provide data for predictive groundwater modeling and to inform the design of pilot tests beginning in February 2024. The scope of work developed for the PDI includes the following:
 - Update the current Site hydrogeologic conceptual site model (HCSM).
 - Perform surface geophysical survey consisting of Electrical Resistivity Imaging (ERI) and Electrical Self-Potential (SP) methods for identifying most advantageous locations for borings.
 - Advance two (or more) exploratory borings and collect detailed subsurface data to include lithologic descriptions; soil, groundwater, and rock core sample collection; packer testing; downhole geophysical logging; and lugeon hydraulic conductivity testing.
 - Monitor groundwater elevation response and fluctuations.
 - Determine and implement disposition of each borehole – for example, monitoring well, tracer injection/extraction well, or temporary securement of open borehole at ground surface – to allow for future decisions on permanent borehole disposition.
 - Evaluate the need for permeation grouting and/or geochemical injection test borings and implement as warranted.
- Continue with implementation, evaluation, and reporting of the PDI efforts as part of the Permeation Grouting/Geochemical Injection Pilot Program for the remediation of arsenic, lithium, and

molybdenum. Following complete evaluation of Site data, a report summarizing the findings and recommended future remedial techniques for the Site will be prepared.

- Evaluation of recently collected MNA parameter data.
- Evaluation of molybdenum, south of the Ash Pond, in context of planned Remedial Action strategies.
- Conduct the first semi-annual groundwater monitoring event and submit the Annual Groundwater Monitoring and Corrective Action Report summarizing the findings to ADEM by July 31, 2024.

Table 2. Parameters And Reporting Limits

Plant Miller Ash Pond
09/25/2023 - 12/01/2023

Appendix III Parameters			
Parameters	Analytical Methods	Reporting Limits	Units of Measure
Boron	EPA 200.7	0.1015	mg/L
Calcium	EPA 200.7	0.406-4.06	mg/L
Chloride	SM4500Cl E	1-160	mg/L
Fluoride	SM4500F G 2017	0.125	mg/L
pH_Field	Field Sampling	NA	SU
Sulfate	SM4500SO4 E 2011	2-160	mg/L
TDS	NA	NA	PPT
Appendix IV Parameters			
Parameters	Analytical Methods	Reporting Limits	Units of Measure
Antimony	EPA 200.8	0.001015	mg/L
Arsenic	EPA 200.8	0.000203	mg/L
Barium	EPA 200.8	0.001015-0.092365	mg/L
Beryllium	EPA 200.8	0.001015	mg/L
Cadmium	EPA 200.8	0.000203	mg/L
Chromium	EPA 200.8	0.001015	mg/L
Cobalt	EPA 200.8	0.000203	mg/L
Fluoride	SM4500F G 2017	0.125	mg/L
Lead	EPA 200.8	0.000203	mg/L
Lithium	EPA 200.7	0.02	mg/L
Mercury	EPA 245.1	0.0005	mg/L
Molybdenum	EPA 200.7	0.01015	mg/L
Selenium	EPA 200.8	0.001015	mg/L
Thallium	EPA 200.8	0.000203	mg/L
Combined Radium 226 + 228	Total Radium Calculation	1.19-1.59	pCi/L

Notes:

1. Reporting Limit values can display range depending upon matrix interferences and dilution factors
2. pH is a field acquired parameter and does not have a laboratory method or reporting limit
3. Combined Radium 226 + 228 – product of radium-226 + radium-228; reporting limits presented are sum of radium 226, radium 228 reporting limits
4. EPA 200.7 – EPA methodology for the "Determination of Metals and Trace Elements in Water and Wastes by Inductively Coupled Plasma-Atomic Emission Spectrometry"
5. EPA 200.8 - EPA methodology for the "Determination of Metals and Trace Elements in Water and Wastes by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS)"
6. SM 2320, 2540, 4500 – Standard Methods for Examination of Water and Wastewater.
7. Total Radium Calculation – Term used herein for EPA 9315 + EPA 9320
8. EPA 9315 – Used for Radium-226; SW-846: Alpha-Emitting Radium Isotopes, part of Test Methods for Evaluation Solid Waste, Physical/Chemical Methods
9. EPA 9320 – Used for Radium-228; SW-846: Alpha-Emitting Radium Isotopes, part of Test Methods for Evaluation Solid Waste, Physical/Chemical Methods

Table 4b. - Field QC: Blank Detections

Plant Miller Ash Pond
04/24/2023 - 10/11/2023

Parameters Detected Above MDL					
Sample Date	QC Location	Parameter	Blank Concentration	Units	MDL
05/01/2023	EB-1	Barium	0.00052 J	mg/L	0.00051
10/11/2023	EB-1	Chromium	0.00027 J	mg/L	0.0002
05/02/2023	FB-5	Chromium	0.00031 J	mg/L	0.0002
05/01/2023	EB-1	Chromium	0.00027 J	mg/L	0.0002

Notes:

1. Lab qualifiers have been appended to result when applicable
2. MDL = Method Detection Limit
3. Only Appendix 4 Constituents were compared and validated. Radium data was not validated.
4. mg/L = milligrams per liter

Table 5. Summary of Background Levels and Groundwater Protection Standards

Plant Miller Ash Pond

Appendix IV Analytes			
Analyte	Units	Background	GWPS
Antimony	mg/L	0.003	0.006
Arsenic	mg/L	0.00645	0.01
Barium	mg/L	12.8	2
Beryllium	mg/L	0.003	0.004
Cadmium	mg/L	0.001	0.005
Chromium	mg/L	0.01	0.1
Cobalt	mg/L	0.00362	0.006
Fluoride	mg/L	0.436	4
Lead	mg/L	0.00189	0.015
Lithium	mg/L	1.3	0.04
Mercury	mg/L	0.0005	0.002
Molybdenum	mg/L	0.0282	0.1
Selenium	mg/L	0.01	0.05
Thallium	mg/L	0.001	0.002
Combined Radium 226 + 228	pCi/L	7.76	5

Notes:

1. mg/L - Milligrams per liter
2. pCi/L - Picocuries per liter
3. Background concentrations/limits are used when determining the groundwater protection standard (GWPS) under 40 CFR §257.95(h) and ADEM Rule 335-13-15-.06(h).
4. GWPS are generally updated on a 2 year basis which began in the Fall of 2019 (Fall 2019, Fall 2021, etc).

2. "<" indicates the result was not detected above the MDL and is considered a non-detect.
3. U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
4. DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
5. mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
6. NC = value not detected with alkalinity calculation

Notes:

1. "J" indicates the result was detected above the MDL but below the PQL
2. "<" indicates the result was not detected above the MDL and is considered a non-detect.
3. U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
4. DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
5. mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
6. NC = value not detected with alkalinity calculation

Notes:

- "J" indicates the result was detected above the MDL but below the PQL
- "<" indicates the result was not detected above the MDL and is considered a non-detect.
- U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
- DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
- mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
- NC = value not detected with alkalinity calculation

Notes:

1. "J" indicates the result was detected above the MDL but below the PQL
2. "<" indicates the result was not detected above the MDL and is considered a non-detect.
3. U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
4. DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
5. mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
6. NC = value not detected with alkalinity calculation

Notes:

1. "J" indicates the result was detected above the MDL but below the PQL
2. "<" indicates the result was not detected above the MDL and is considered a non-detect.
3. U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
4. DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
5. mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
6. NC = value not detected with alkalinity calculation

Notes:

1. "J" indicates the result was detected above the MDL but below the PQL
2. "<" indicates the result was not detected above the MDL and is considered a non-detect.
3. U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
4. DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
5. mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
6. NC = value not detected with alkalinity calculation

Analytical Results Summary Plant Miller Ash Pond 09/25/2023 - 10/12/2023

General Chemistry and MNA Parameters										
Hydraulic Location	Well	Sample Date	Sodium mg/L	Silica mg/L	Iron Total mg/L	Sulfide mg/L	Silicon mg/L	Carbon, Total Organic mg/L	Alkalinity Total as CaCO3 mg CaCO3/L	Carbonate Alkalinity as CaCO3 mg CaCO3/L
Horiz. Delineation	MR-AP-MW-36HR	10/12/2023	723	11.4	0.227	0	5.31	1.58 J	237	1.37
Horiz. Delineation	MR-AP-MW-37H	10/09/2023	67.6	25.5	0.405	0	11.9	<1	233	1.61

Notes:

1. "J" indicates the result was detected above the MDL but below the PQL
2. "<" indicates the result was not detected above the MDL and is considered a non-detect.
3. U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
4. DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
5. mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
6. NC = value not detected with alkalinity calculation

Table 7. Second Semi-Annual Monitoring Event

Analytical Results Summary
Plant Miller Ash Pond
09/25/2023 - 10/12/2023

General Chemistry and MNA Parameters			
Hydraulic Location	Well	Sample Date	Bicarbonate Alkalinity as CaCO ₃ mg CaCO ₃ /L
Horiz. Delineation	MR-AP-MW-36HR	10/12/2023	236
Horiz. Delineation	MR-AP-MW-37H	10/09/2023	231

Notes:

1. "J" indicates the result was detected above the MDL but below the PQL
2. "<" indicates the result was not detected above the MDL and is considered a non-detect.
3. U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
4. DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
5. mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
6. NC = value not detected with alkalinity calculation

Table 8.
Pottsville Background - Lithium and Boron Concentrations

Well Name	Facility	Pottsville Coal Group ID	Lithium Concentrations	Boron Concentrations	Well Depth (ft.) Below Top of Casing
MR-AP-MW-21	Miller AP	Mary Lee (Lower)	0.0252 - 0.0493	0.0619 - 0.1010	183.64
MR-AP-MW-22S	Miller AP	Mary Lee (Lower)	0.0694 - 0.1720	0.0628 - 0.1340	50.00
MR-AP-MW-22I	Miller AP	Mary Lee (Lower)	0.0728 - 0.1410	0.1350 - 0.1730	141.40

MR-AP-MW-23	Miller AP	Mary Lee (Lower)	1.05 - 1.20	0.7560 - 0.7990	67.57
MR-AP-MW-23A	Miller AP	Mary Lee (Lower)	1.05 - 1.17	0.6940 - 0.7060	68.10
GS-AP-MW-8	Gorgas AP	Pratt (Upper)	ND - 0.008	ND - 0.0239	64.59
GS-AP-MW-13	Gorgas AP	Pratt (Upper)	ND - 0.0118	ND	113.17
GS-AP-MW-16S	Gorgas AP	Pratt (Upper)	0.0740 - 0.1030	0.0762 - 0.0777	133.38
GS-AP-MW-17V	Gorgas AP	Cobb to Pratt Transition	0.0574 - 0.0809	0.0337 - 0.0532	151.4
MW-1	Gorgas Landfills	Pratt + Mine Backfill	0.0241 - 0.0301	ND - 0.0307	104.59
MW-2	Gorgas Landfills	Pratt + Mine Backfill	0.0353 - 0.0677	ND - 0.0371	91.04
MW-3	Gorgas Landfills	Pratt + Mine Backfill	0.0689 - 0.419	ND - 0.0548	115.33
MW-4	Gorgas Landfills	Pratt + Mine Backfill	0.0446 - 0.0558	ND - 0.0526	126.67

1. Concentrations presented in mg/L
2. ND - Not detected above Method Detection Limit (MDL)
3. Top of screen and bottom of screen depths are calculated relative to Top of Casing elevation and less the well sump length of 0.4' or 0.5'.
4. Data updated April 2021

Analytical Report

Sample Group : WMWMILAP_1408

Project/Site : Miller Ash Pond
Quinton, AL 35130

For : Southern Company Services
3535 Colonade Parkway
Birmingham, AL 35243

Attention : Dustin Brooks & Greg Dyer

Released By : Brooke Caton
tbwill@southernco.com
(205) 664-6101

June 12, 2023

Dear Dustin Brooks,

Enclosed are the analytical results for sample(s) received by the laboratory between April 20, 2023 and May 04, 2023. All results reported herein conform to the laboratory's most current Quality Assurance Manual. Results marked with an asterisk conform to the most current applicable TNI/NELAC requirements. Exceptions will be noted in the body of the report.

Laboratory certification ID: E571114
Issued By: State of Florida, Department of Health
Expiration: June 30, 2023

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Quality Control: **Brooke

4. All of the above samples were analyzed by EPA 200.7 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed, and all criteria were met.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were analyzed, and all criteria were met.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- All calibration curve requirements were within acceptance criteria.

- All sample internal standard criteria were met.
- The spectral interference check associated with EPA 200.7 was analyzed, and all acceptance criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for accuracy were met except for the following:
 - BD07888 Calcium & Sodium MS/MSD spike levels were <30% of the sample concentrations.
 - BD08202 Calcium, Magnesium & Sodium MS/MSD spike levels were <30% of the sample concentrations.
 - BD08680 Lithium MS and/or MSD recovery is outside of specification limit.
 - BD08680 Calcium, Iron, Magnesium, & Sodium MS/MSD spike level was <30% of the sample concentration.
 - BD08686 Calcium, Iron, & Sodium MS/MSD spike levels were <30% of the sample concentrations.
 - A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for precision were met.
7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

<u>Sample ID</u>	<u>Analyte</u>	<u>Dilution Factor</u>
BD07879	Sodium	10.15

4. All of the above samples were analyzed and prepared by EPA 200.7 for dissolved analysis.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed, and all criteria were met.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were analyzed, and all criteria were met.
- Due to no filtered method blank (MB) or laboratory control sample (LCS) submitted with the sample set, an unfiltered MB and LCS were analyzed with the samples in each batch.
- All laboratory control sample criteria were met.
- The method blank associated with each batch passed all acceptance criteria for all requested analytes.
- All calibration curve requirements were within acceptance criteria.
- All sample internal standard criteria were met.
- The spectral interference check associated with EPA 200.7 was analyzed and all acceptance criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were analyzed with each ICP batch. All acceptance criteria for accuracy were met except for the following:
 - BD07888 Calcium & Sodium MS/MSD spike levels were <30% of the sample concentrations.
 - BD08199 Sodium MS/MSD spike levels were <30% of the sample concentrations.
 - BD08202 Calcium, Magnesium, & Sodium MS/MSD spike level was <30% of the sample concentration.
 - BD08672 Sodium MS/MSD spike levels were <30% of the sample concentrations.
 - BD08684 Calcium, Magnesium, & Sodium MS/MSD spike levels were <30% of the sample concentrations.
 - BD08686 Calcium & Sodium MS/MSD spike level was <30% of the sample concentration.
 - A matrix spike and matrix spike duplicate were analyzed with each ICP batch. All acceptance criteria for precision were met.
7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

<u>Sample ID</u>	<u>Analyte</u>	<u>Dilution Factor</u>
BD07879	Sodium	10.15
BD07880	Calcium	10.15
BD07881	Calcium	10.15

4. All of the above samples were analyzed by EPA 200.8 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All tune and calibration met criteria for all requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.

- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- The interference check samples associated with EPA 200.8 were analyzed and passed for all requested analytes.
- All sample internal standard criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for accuracy were met except for the following:
 - BD08680 Manganese MS/MSD spike level was <30% of the sample concentration.
 - A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for precision were met.
7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

<u>Sample ID</u>	<u>Analyte</u>	<u>Dilution Factor</u>
BD07887	Manganese	5.075
BD07890	Manganese	5.075
BD07891	Manganese	5.075
BD08190	Manganese	5.075
BD08193	Manganese	5.075
BD08194	Manganese	5.075
BD08195	Manganese	5.075
BD08196	Manganese	5.075
BD08661	Barium	10.15
BD08662	Barium	92.365
BD08673	Manganese	5.075
BD08680	Manganese	5.075

8. The raw data results are shown with dilution factors included.

4. All of the above samples were analyzed and prepared by EPA 200.8 for dissolved analysis.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All tune and calibration met criteria for all requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- Due to no filtered method blank (MB) or laboratory control sample (LCS) submitted with the sample set, an unfiltered MB and LCS were analyzed with the samples in each batch.
- All laboratory control sample criteria were met.
- The method blank associated with each preparation batch passed all acceptance criteria for all requested analytes.
- The interference check samples associated with EPA 200.8 were analyzed and passed for all requested analytes.
- All sample internal standard criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were analyzed with each ICPMS batch. All acceptance criteria for accuracy were met.
 - BD08683 Selenium MS/MSD were analyzed. Matrix spike information could not be reported for this sample due to software limitations. MS recovery was 96.6% and MSD recovery was 98.1%
 - A matrix spike and matrix spike duplicate were analyzed with each ICPMS batch. All acceptance criteria for precision were met.
 - BD08683 Selenium MS/MSD were analyzed. Matrix spike information could not be reported for this sample due to software limitations. MS/MSD precision was 1.53%.
7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

<u>Sample ID</u>	<u>Analyte</u>	<u>Dilution Factor</u>
BD07887	Manganese	5.075
BD07890	Manganese	5.075

4. All of the above samples were analyzed and prepared by EPA 245.1.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the method detection limit for the requested analyte.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analyte.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analyte.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.

- The method blank associated with each digestion batch was below the limit of quantitation for the requested analyte.
- All calibration met criteria for the requested analyte.
- All response signals were satisfactory.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each analytical batch. All acceptance criteria for accuracy were met.
- A matrix spike and matrix spike duplicate were digested and analyzed with each analytical batch. All acceptance criteria for precision were met.

7. All samples were analyzed without a dilution.

4. All of the above samples were prepared and analyzed by Standard Method 2540C.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- A Method Blank was analyzed with each batch. All criteria were met.
- All final weights of samples, standards, and blanks agreed within 0.5mg of the previous weight.
- A sample duplicate was analyzed with each batch, and RPD was $\leq 10\%$.
- A laboratory control sample was analyzed with each batch. All criteria were met.
- Samples were between 2.5mg and 200mg residue.
- All samples with residue $< 2.5\text{mg}$ had the maximum volume of 150mL filtered. Affected samples are as follows:
 - BD08189
 - BD08197
 - BD08201
 - BD08663
 - BD08670

4. All of the above samples were analyzed and prepared by Standard Method 2320B.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- An initial pH check was analyzed with each batch. The acceptance criteria were met.
 - A final pH check was analyzed with each batch. The acceptance criteria were met.
 - An alkalinity laboratory control sample was analyzed with each batch. Range criteria of within 10% of true value was met.
 - An alkalinity sample duplicate was analyzed with each batch. Precision criteria less than 10 RPD was met.
7. The following samples had pH>10 and/or TDS>500mg/L. Therefore, the calculations for carbonate and bicarbonate are estimates:

4. All of the above samples analyzed and prepared by SM4500 Cl E, SM4500 F G, and SM4500 SO4 E.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All calibration met criteria for the requested analyte.
- Prior to sample analysis, an initial calibration verification (ICV), and all criteria were met.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and was below half the limit of quantitation for the requested analyte.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analyte.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analyte.

- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for accuracy were met.
 - A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for precision were met.
7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

<u>Sample ID</u>	<u>Analyte</u>	<u>Dilution Factor</u>

4. All of the above samples were prepared and analyzed for NO_x by EPA 353.2.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Water baseline report was run and met criteria.
- All calibration met criteria for the requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and met all criteria.
- All continued calibration verification (CCV) were within the acceptance criteria.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and were below limit of detection.
- All continued calibration blanks (CCB) were below the limit of detection.

EPA 353.2 Specific QC:

- Prior to sample analysis, Cadmium coil reduction efficiency check met criteria.
 - Matrix Specific QC:
 - A sample duplicate was run and criteria for precision was met.
 - A matrix spike was run and criteria for accuracy was met.
7. All samples were analyzed without a dilution factor.
8. The raw data results are shown with dilution factors included.

Total Organic Carbon

Miller Ash Pond

1. This report consists of all MWs and corresponding Lab IDs listed on the Chain of Custody.
2. Refer to comments on Chain of Custody for information regarding sample receipt.
3. All standards and solutions meet NELAP traceability requirements and were used within their recommended shelf life.

4. All of the above samples were prepared and analyzed by Standard Method 5310B.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All calibration criteria were met.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and met all criteria.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and was $<1/2RL$.
- All continued calibration verifications (CCVs) were within the acceptance range.
- All continued calibration blanks (CCBs) were $<1/2RL$.

Matrix Specific Quality Control Procedures:

- A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for accuracy were met.
 - A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for precision were met.
7. All samples were analyzed without a dilution.
 8. The raw data results are shown with dilution factors included.

BD08686	Solids, Dissolved	mg/L	0.0000	25.0			924	56.0	40.0 to 60.0			0.434	10.0

Comments: Filtered LCS and MB were not submitted or analyzed with Dissolved Metals.

Definitions

Project Number: WMWMILAP_1408

Abbreviation	Description
DF	Dilution Factor
LCS	Lab Control Sample
LFM	Lab Fortified Matrix
MB	Method Blank
MDL	Method Detection Limit; minimum concentration of an analyte that can be determined with 99% confidence that the concentration is greater than zero.
MS	Matrix Spike
MSD	Matrix Spike Duplicate
Prec	Precision (% RPD)
Q	Qualifier; comment used to note deviations or additional information associated with analytical results.
QC	Quality Control
Rec	Recovery of Matrix Spike
RL	Reporting Limit; lowest concentration at which an analyte can be quantitatively measured.
Vio Spec	Violation Specification; regulatory limit which has been exceeded by the sample analyzed.

Qualifier	Description
A	Bicarbonate alkalinity, carbonate alkalinity, hydroxide alkalinity, free carbon dioxide, and/or total carbon dioxide calculations are estimates due to pH>10SU and/or TDS>500mg/L.
C	Analyte was verified by re-analysis.
FA	Field results were reviewed by the Water Field Group. Refer to APC Field Case Narrative.
J	Reported value is an estimate because concentration is less than reporting limit.
R	Matrix spike recovery and/or matrix spike duplicate recovery is outside of specification limit.
RA	Matrix spike is invalid due to sample concentration.
U	Compound was analyzed, but not detected.

RE: Project: WMWMILAP_1408
Pace Project No.: 30586893

Dear Brooke Caton:

Enclosed are the analytical results for sample(s) received by the laboratory on May 10, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

(Greensburg, PA) - Revision 1 - This report replaces the 6/15/23 report. This project was revised on 6/20/23 in order to change a sample ID per client request.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Skyler C. Richmond
skyler.richmond@pacelabs.com

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, LLC.

PROJECT NARRATIVE

Project: WMWMILAP_1408

Pace Project No.: 30586893

Method: EPA 9315

Description: 9315 Total Radium

Client: Alabama Power

Date: June 20, 2023

General Information:

61 samples were analyzed for EPA 9315 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:

All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

PROJECT NARRATIVE

Project: WMWMILAP_1408

Pace Project No.: 30586893

Method: EPA 9320

Description: 9320 Radium 228

Client: Alabama Power

Date: June 20, 2023

General Information:

61 samples were analyzed for EPA 9320 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:

All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:

PROJECT NARRATIVE

Project: WMWMILAP_1408
Pace Project No.: 30586893

Method: Total Radium Calculation
Description: Total Radium 228+226
Client: Alabama Power
Date: June 20, 2023

General Information:

55 samples were analyzed for Total Radium Calculation by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:

All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

This data package has been reviewed for quality and completeness and is approved for release.

QUALIFIERS

Project: WMWMILAP_1408
Pace Project No.: 30586893

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Act - Activity

Unc - Uncertainty: For Safe Drinking Water Act (SDWA) analyses, the reported Unc. is the calculated Count Uncertainty (95% confidence interval) using a coverage factor of 1.96. For all other matrices (non-SDWA), the reported Unc. is the calculated Expanded Uncertainty (aka Combined Standard Uncertainty, CSU), reported at the 95% confidence interval using a coverage factor of 1.96.

Gamma Spec: The Unc. reported for all gamma-spectroscopy analyses (EPA 901.1), is the calculated Expanded Uncertainty (CSU) at the 95.4% confidence interval, using a coverage factor of 2.0.

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

Field Case Narrative

Miller Ash Pond

2023 Compliance Event 2

All samples were collected using methods defined in Alabama Power's Water Field Group Low-Flow Groundwater Sampling Procedure and the associated site-specific Sampling and Analysis Plan (SAP).

No samples were collected for well MW-4V due to insufficient water levels in the well.

TOC only was recollected for well MW-12 on 10/11/2023. Field data uploaded for MW-12 represents data collected on the original sample date of 10/02/2023.

The first 17 field readings for pH at MW-1 were qualified due to pH readings falling outside of the bracketed calibration range. The below qualifier was used:

- E – Estimated reported value exceeded calibration range

Field quality control procedures were performed as follows:

- Blanks and Sample Duplicates were collected as described in the SAP.
- Calibration verification for all required field parameters were performed daily, before and after sample collection.

Analytical Report

Sample Group : WMWMILAP_1426

Project/Site : Miller Ash Pond
Quinton, AL 35130

For : Southern Company Services
3535 Colonade Parkway
Birmingham, AL 35243

Attention : Dustin Brooks & Greg Budd

Released By : Brooke Caton
tbwill@southernco.com
(205) 664-6101

November 21, 2023

Dear Dustin Brooks,

Enclosed are the analytical results for sample(s) received by the laboratory between September 28, 2023 and October 12, 2023. All results reported herein conform to the laboratory's most current Quality Assurance Manual. Results marked with an asterisk conform to the most current applicable TNI/NELAC requirements. Exceptions will be noted in the body of the report.

Laboratory certification ID: E571114
Issued By: State of Florida, Department of Health
Expiration: June 30, 2024

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Quality Control: **Brooke

4. All of the above samples were analyzed by EPA 200.7 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed, and all criteria were met.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were analyzed, and all criteria were met.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- All calibration curve requirements were within acceptance criteria.
- All sample internal standard criteria were met.
- The spectral interference check associated with EPA 200.7 was analyzed, and all acceptance criteria were met.

- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for accuracy were met, except for the following:
 - BD18588 Calcium & Sodium MS/MSD spike levels were less than 30% of the sample concentrations.
 - BD18598 Sodium MS/MSD spike levels were less than 30% of the sample concentrations.
 - BD18970 Calcium MS/MSD spike levels were less than 30% of the sample concentrations.
 - BD19000 Calcium, Magnesium, & Sodium MS/MSD spike levels were less than 30% of the sample concentrations.
 - BD19003 Sodium MS/MSD spike levels were less than 30% of the sample concentrations.
 - A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for precision were met.
7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

<u>Sample ID</u>	<u>Analyte</u>	<u>Dilution Factor</u>
BD18198	Calcium, Sodium	10.15
BD18199	Calcium, Iron, Magnesium	10.15

4. All of the above samples were analyzed and prepared by EPA 200.7 for dissolved analysis.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed, and all criteria were met.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were analyzed, and all criteria were met.
- Due to no filtered method blank (MB) or laboratory control sample (LCS) submitted with the sample set, an unfiltered MB and LCS were analyzed with the samples in each batch.
- All laboratory control sample criteria were met.
- The method blank associated with each batch passed all acceptance criteria for all requested analytes.
- All calibration curve requirements were within acceptance criteria.
- All sample internal standard criteria were met.
- The spectral interference check associated with EPA 200.7 was analyzed and all acceptance criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were analyzed with each ICP batch. All acceptance criteria for accuracy were met, except for the following:
 - BD18204 Calcium, Iron, & Magnesium MS/MSD spike levels were less than 30% of the sample concentrations.
 - BD18589 Calcium & Sodium MS/MSD spike levels were less than 30% of the sample concentrations.
 - BD18599 Sodium MS/MSD spike levels were less than 30% of the sample concentrations.
 - BD18600 Calcium, Magnesium, & Sodium MS/MSD spike levels were less than 30% of the sample concentrations.
 - BD18972 Calcium MS/MSD spike levels were less than 30% of the sample concentrations.
 - BD19003 Sodium MS/MSD spike levels were less than 30% of the sample concentrations.
 - A matrix spike and matrix spike duplicate were analyzed with each ICP batch. All acceptance criteria for precision were met.
7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

4. All of the above samples were analyzed by EPA 200.8 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All tune and calibration met criteria for all requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- The interference check samples associated with EPA 200.8 were analyzed and passed for all requested analytes.
- All sample internal standard criteria were met.

- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for accuracy were met, except the following:
 - BD18588 Manganese MS/MSD spike levels were less than 30% of the sample concentrations.
 - BD18970 Aluminum MS and/or MSD recovery is outside of specification limit.
 - BD19003 Barium MS and/or MSD recovery is outside of specification limit.
 - A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for precision were met.
7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

<u>Sample ID</u>	<u>Analyte</u>	<u>Dilution Factor</u>
BD18199	Manganese	5.075
BD18200	Manganese	5.075

4. All of the above samples were analyzed and prepared by EPA 245.1.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the method detection limit for the requested analyte.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analyte.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analyte.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch was below the limit of quantitation for the requested analyte.
- All calibration met criteria for the requested analyte.
- All response signals were satisfactory.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each analytical batch. All acceptance criteria for accuracy were met.
 - A matrix spike and matrix spike duplicate were digested and analyzed with each analytical batch. All acceptance criteria for precision were met.
7. All samples were analyzed without a dilution.

4. All of the above samples were prepared and analyzed by Standard Method 2540C.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- A Method Blank was analyzed with each batch. All criteria were met.
- All final weights of samples, standards, and blanks agreed within 0.5mg of the previous weight.
- A sample duplicate was analyzed with each batch, and RPD was $\leq 10\%$.
- A laboratory control sample was analyzed with each batch. All criteria were met.
- Samples were between 2.5mg and 200mg residue.
- All samples with residue $< 2.5\text{mg}$ had the maximum volume of 150mL filtered. Affected samples are as follows:
 - BD18205
 - BD18585
 - BD18601
 - BD18967
 - BD18971
 - BD18998
 - BD19002

4. All of the above samples were prepared and analyzed by Standard Method 2320B.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- An initial pH check was analyzed with each batch. The acceptance criteria were met.
 - A final pH check was analyzed with each batch. The acceptance criteria were met.
 - An alkalinity laboratory control sample was analyzed with each batch. Range criteria of within 10% of true value was met.
 - An alkalinity sample duplicate was analyzed with each batch. Precision criteria less than 10 RPD was met.
7. The following samples had pH>10 and/or TDS>500mg/L. Therefore, the calculations for carbonate and bicarbonate are estimates:

4. All of the above samples were analyzed and prepared by SM4500 Cl E, SM4500 F G, and SM4500 SO4 E.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All calibration met criteria for the requested analyte.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and was below half the limit of quantitation for the requested analyte.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analyte.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analyte.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any

qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for accuracy were met.
 - A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for precision were met.
7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

<u>Sample ID</u>	<u>Analyte</u>	<u>Dilution Factor</u>

4. All of the above samples were prepared and analyzed for NO_x by EPA 353.2.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Water baseline report was run and met criteria.
- All calibration met criteria for the requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and met all criteria.
- All continued calibration verification (CCV) were within the acceptance criteria.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and were below limit of detection.
- All continued calibration blanks (CCB) were below the limit of detection.

EPA 353.2 Specific QC:

- Prior to sample analysis, Cadmium coil reduction efficiency check met criteria.
- Matrix Specific QC:

Case Narrative

- A sample duplicate was run and criteria for precision was met.
 - A matrix spike was run and criteria for accuracy was met, except for the following:
 - BD18999 MS and/or MSD recovery is outside of specification limit.
7. All samples were analyzed without a dilution factor.
8. The raw data results are shown with dilution factors included.

4. All of the above samples were prepared and analyzed by Standard Method 5310B.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All calibration criteria were met.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and met all criteria.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and was <1/2RL.
- All continued calibration verifications (CCVs) were within the acceptance range.
- All continued calibration blanks (CCBs) were <1/2RL.

Matrix Specific Quality Control Procedures:

- A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for accuracy were met, expect the following:
 - BD18997 MS and/or MSD recovery is outside of specification limit.
- A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for precision were met.

Case Narrative

7. All samples were analyzed without a dilution factor.
8. The raw data results are shown with dilution factors included.
