Southern Company Services
Earth Science and Environmental Engineering

CERTIFICATION STATEMENT

This 2022 Annual Groundwater Monitoring and Corrective Action Report, Alabama Power Company - Plant Gorgas Ash Pond has been prepared in accordance with the United States Environmental Protection Agency's coal combustion residual rule (40 CFR Part 257, Subpart D) and ADEM Admin. Code Ch. 335-13-15 under the supervision of a licensed professional engineer in the State of Alabama. As such, I certify that the information contained herein is true and accurate to the best of my knowledge.

EXECUTIVE SUMMARY

In accordance with the United States Environmental Protection Agency (EPA) coal combustion residual (CCR) rule (40 CFR Part 257, Subpart D), the State of Alabama Department of Environmental Management (ADEM) Admin. Code Ch. 335-13-15, and ADEM Administrative Order (AO) No. 18-096-GW, this 2022 Annual Groundwater Monitoring and Corrective Action Report has been prepared to document 2022 semi-annual groundwater monitoring activities at the Plant Gorgas Ash Pond (Ash Pond) and to satisfy the requirements of § 257.90(e), ADEM Admin. Code r. 335-13-15-.06(1)(e), and Part E of AO No. 18-096-GW. Semi-annual monitoring and associated reporting for Plant Gorgas Ash Pond is performed in accordance with the monitoring requirements § 257.90 through § 257.98 and ADEM Admin. Code r. 335-13-15-.06(1) through r. 335-13-15-.06(9).

The CCR unit began the monitoring period in corrective action pursuant to § 257.98, ADEM Admin. Code r. 335-13-15-.06(9), and AO No. 18-096-GW. Statistically significant increases (SSI) of Appendix III constituents over background were identified in the results of the first detection monitoring event, and assessment monitoring was initiated in January 2018. Statistically significant levels (SSL) of Appendix IV parameters above groundwater protection standards (GWPS) were identified while in assessment monitoring. Consequently, an assessment of corrective measures (ACM) was initiated on January 13, 2019, and completed on June 12, 2019, according to the requirements of § 257.96, ADEM Admin. Code r. 335-13-15-.06(7), and AO No. 18-096-GW. The ACM was subsequently submitted to ADEM and posted to the Ash Pond (Site) CCR compliance website. A public meeting to discuss the ACM was held on July 1, 2020.

Since the submittal of the ACM extensive Site investigations have been performed to select effective corrective measures to address SSLs above GWPS. A Groundwater Remedy Selection Report was prepared to meet the requirements of § 257.97, ADEM Admin. Code r. 335-13-15-.06(8), and Part C of AO No. 18-096-GW and submitted December 16, 2021. Subsequently, within 90 days of remedy selection, a Corrective Action Groundwater Monitoring Program describing implementation and monitoring of selected remedies at the Site was submitted on March 15, 2022.

SSLs of Appendix IV parameters arsenic, lithium, and molybdenum were detected above GWPS during the semi-annual monitoring events of 2022. The following summarizes results and activities conducted in 2022:

- Submitted 2021 Annual Groundwater Monitoring and Corrective Action Report on January 31, 2022.
- Submitted the Corrective Action Groundwater Monitoring Program document on March 15, 2022.
- Completed the first semi-annual groundwater monitoring event between February 7, 2022, and March 4, 2022, which included the first round of sampling for the nineteen new or replacement compliance and delineation wells installed during the Fall of 2021
- Conducted a re-sampling event for combined radium 226 + 228 at select monitoring locations where outliers were suspected.
- Submitted the 2022 First Semi-Annual Groundwater Monitoring and Corrective Action Report on July 31, 2022.
- Collection of well precipitate samples, groundwater samples, and conducted geochemical modeling to determine feasibility of implementing geochemical manipulation (injections) north of the dam in the vicinity of wells GS-AP-MW-6S, GS-AP-MW-7, and GS-AP-MW-41HD. This approach, if feasible, could be used in-conjunction with permeation grouting to remediate area of highest concentration at the Site (July-August 2022).
- Completed the second semi-annual monitoring event between July 18, 2022, and August 11, 2022.

The CCR unit concluded the monitoring period in corrective action and APC has begun implementing the selected groundwater remedies identified in the Groundwater Remedy Selection Report submitted to ADEM in December 2021 and as detailed in the Corrective Action Groundwater Monitoring Program document. The following monitoring-related activities are planned for the CCR unit:

- Continue with phase 1 implementation of the Permeation Grouting Pilot Program for the remediation of arsenic, lithium, and molybdenum.
- Installation of continuous monitoring instrumentation for the monitoring of potential changes in field parameter data in response to ash pond closure activities.
- Evaluation of collected MNA parameter data.
- Conduct the first semi-annual monitoring event of 2023 and submit the semi-annual groundwater monitoring report summarizing the findings to ADEM by July 31, 2023.

**Executive Summary Table.
Monitoring Period Summary
Plant Gorgas - Ash Pond**

Assessment Monitoring Initiated: January 15, 2018
 Monitoring Period: January 1 - December 31, 2022
 Beginning Status: Corrective Action
 Ending Status: Corrective Action

Statistical Analysis Results *

Appendix III SSIs

| Parameter | Wells |
|-----------|--|
| Boron | GS-AP-MW-2, GS-AP-MW-6S, GS-AP-MW-6D, GS-AP-MW-7, GS-AP-MW-21. |
| Calcium | GS-AP-MW-6S, GS-AP-MW-6D, GS-AP-MW-19. |
| Chloride | GS-AP-MW-2, GS-AP-MW-6S, GS-AP-MW-6D, GS-AP-MW-7, GS-AP-MW-15, GS-AP-MW-17, GS-AP-MW-19, GS-AP-MW-21. |
| Fluoride | GS-AP-MW-2, GS-AP-MW-15. |
| pH | GS-AP-MW-2, GS-AP-MW-12, GS-AP-MW-12V, GS-AP-MW-15, GS-AP-MW-17, GS-AP-MW-19, GS-AP-MW-21. |
| Sulfate | GS-AP-MW-2, GS-AP-MW-6S, GS-AP-MW-6D, GS-AP-MW-7, GS-AP-MW-12, GS-AP-MW-16D, GS-AP-MW-19, GS-AP-MW-21. |

1.0 INTRODUCTION

In accordance with the United States Environmental Protection Agency (EPA) coal combustion residual (CCR) rule (40 CFR Part 257, Subpart D) the State of Alabama Department of Environmental Management (ADEM) Admin. Code Ch. 335-13-15, and Administrative Order (AO) No. 18-096-GW this 2022 Annual Groundwater Monitoring and Corrective Action Report has been prepared to document 2022 semi-annual groundwater monitoring activities at the Plant Gorgas Ash Pond (Ash Pond) and to satisfy the requirements of §257.90(e), ADEM Admin. Code r. 335-13-15-.06(1)(e), and Part E AO 18-096-GW. Semi-annual monitoring and associated reporting for the Ash Pond (Site) is performed in accordance with the monitoring requirements § 257.90 through § 257.98 and ADEM Admin. Code r. 335-13-15-.06(1) through r. 335-13-15-.06(9).

Semi-Annual Groundwater Monitoring and Corrective Action Reports include an update on groundwater delineation activities completed since the submittal of the Facility Plan for Groundwater Investigation (November 13, 2018) and corrective action activities completed since the submittal of the Corrective Action Groundwater Monitoring Program (March 15, 2022).

2.0 MONITORING PROGRAM STATUS

The Site is currently in corrective action and APC will continue implementation of the selected groundwater remedies identified in the Groundwater Remedy Selection Report and the Corrective Action Groundwater Monitoring Program. In accordance with § 257.94(e) and ADEM Admin. Code r. 335-13-15-.06(5)(e), APC implemented assessment monitoring in January 2018. SSLs of Appendix IV parameters were identified at the Gorgas Ash Pond during assessment sampling events. Pursuant to § 257.95(g)(3)(i) and ADEM Admin. Code r. 335-13-15-.06(6)(g)4.(i), APC completed an ACM in accordance with § 257.96, ADEM Admin. Code r. 335-13-15-.06(7), and AO No. 18-096-GW. The ACM was completed June 12, 2019, and a public meeting was held to discuss the ACM on July 1, 2020.

In accordance with § 257.97(a), ADEM Admin. Code r. 335-13-15-.06(8)(a), and Part C of Administrative Order No. 18-096-GW, Semi-Annual Remedy Selection and Design Progress Report(s) were submitted beginning in December 2019. The semi-annual progress reports were prepared to describe the progress made in selecting and designing a remedy for the Site. A Groundwater Remedy Selection Report was prepared and submitted on December 16, 2021, to meet the requirements of 40 CFR § 257.97, ADEM Admin. Code r. 335-13-15-.06(8), and Part C of AO No. 18-096-GW. Subsequently, within 90 days of remedy selection, a Corrective Action Groundwater Monitoring Program was developed and submitted on March 15, 2022.

In accordance with § 257.98 and ADEM Admin. Code r. 335-13-15-.06(9), APC will continue semi-annual monitoring, including all monitoring wells in the certified groundwater monitoring system and any well installed to characterize the horizontal and vertical extent of SSLs. APC will continue with implementation of the groundwater remedies described in the Groundwater Remedy Selection Report and Corrective Action Groundwater Monitoring Program document.

3.0 SITE LOCATION AND DESCRIPTION

The Alabama Power Company (APC) William Crawford Gorgas Electric Generating Plant (Plant Gorgas) is in southeastern Walker County, Alabama, approximately 15 miles south of Jasper, at 460 Gorgas Road, Parrish, AL 35580. Based on visual inspection of USGS topographic quadrangle maps and GIS plant boundary files provided by SCS, the plant occupies portions of Sections 7, 8, 9, 16, 17, 18, 19, 20, 21, 28 and 29, Township 16 South, Range 6 West and Section 12, 13 and 24, Township 16 South, Range 7 West (USGS, 1975; USGS, 1983). The Ash Pond is located southeast of the main plant on the opposite side of the Black Warrior River. **Figure 1, Site Location Map**, depicts the location of the Plant and Ash Pond with respect to the surrounding area.

3.1 PHYSICAL SETTING

Plant Gorgas is in the Black Warrior River basin, an area typified by moderate relief, with river and stream valleys having dendritic drainage patterns. Elevations at the site range from approximately 260 feet above mean sea level (MSL) near the Mulberry Fork to over 600 feet MSL east of the Ash Pond. The Ash Pond occupies a localized, narrow valley where ground elevations are higher to the west, north, and east of the Ash Pond. Ground elevations typically range between 400 and 600 feet MSL and can have steep slopes down to the Ash Pond, which historically resides around elevation 380 ft MSL. **Figure 2, Site Topographic Map**, provides the topography of the Site.

3.2 SITE GEOLOGY AND HYDROGEOLOGY

Plant Gorgas lies in the Warrior Basin physiographic region (Sapp and Emplaincourt, 1975), a late Paleozoic basin formed as a result of flexure and sediment loading associated with Appalachian and Ouachita orogenies. The bedrock geology is dominated by clastic sedimentary rocks of the Upper Pottsville Formation as shown on **Figure 3, Site Geologic Map** (GSA, 2010b). The Upper Pottsville formation directly underlies Plant Gorgas and extends down to a depth of approximately 2,100 feet below ground surface. This formation is characterized by cyclic sequences (cyclothems) of marginal marine shale/claystone, siltstone, sandstone, conglomerates, and individual coal beds. These depositional cyclothems reflect the sediment balance controlled by 4th or 5th order glacial eustasy, continued basin evolution, and variations in sedimentation rates (Pashin and Raymond, 2004). Deeper stratigraphy is marked by carbonates, shales, chert, and sandstones of Mississippian to Cambrian age (Raymond et al., 1988).

The Plant Gorgas Ash Pond is directly underlain by rocks belonging to the Pratt Coal Group (Ward II et al., 1989) of the Lower Pottsville Formation. In general, the Pratt Coal Group consists of mudstone, shale, fine-grained sandstone, and interbedded coal in fining-upward sequences. Stratigraphically, at the Site, the Pratt Coal Group can generally be characterized as a (1) lower, coal measures interval, (2) a predominantly mudstone or shale interval, and (3) an upper sandstone interval. As indicated on geologic cross-sections provided in this report, only the lower, coal measures interval and mudstone/shale interval intersect or underlie the Ash Pond as the upper sandstone interval (as well as Cobb Group strata) typically forms the caprock for ridges on either side of the Ash Pond.

The Pratt Coal Group generally contains three named coal seams, each separated by 25 to 50 feet of intra-burden. In descending order, they are, the Pratt, Nickel Plate, and American coal seams. Locally, Pratt Coal Group strata gently dip to the south and south-southwest. As noted in the Supplemental Site Hydrogeological Characterization Report submitted in March 2021 (SCS, 2021) local variations in dip direction and magnitude are observed at the site and may be attributable to localized fault displacement, elevations at the time of deposition, and potential presence of a synclinal structural feature. The top of the Pratt Coal Group occurs at depths between 70 and 225 feet below ground surface or at elevations between 350 and 240 feet MSL. Pratt coals generally fit the following patterns:

- Beneath the site, the Pratt coal is generally 3 to 4-ft thick and overlies the Nickel Plate Seam, separated by a 10 to 12-ft sequence of claystone grading downward to sandstone.
- Locally, the Nickel Plate seam is not very prominent and is generally under 1.5 feet in thickness.
- The American seam generally resides 15 and 25 feet beneath the Nickel Plate Seam and is separated primarily by a sandstone bed. The American seam generally thickens towards the south where it was underground mined (Maxine Mine).

Figures 4A-4H, Geologic Cross-Sections, provide an illustration of the Pottsville strata underlying the site.

The Pottsville aquifer system is the primary aquifer in Walker County. Although on a regional scale there are other aquifer systems in the vicinity of Plant Gorgas, the Pottsville aquifer system is the most significant. The nearest exposure of the Valley and Ridge aquifer system occurs in central Jefferson County, approximately 25 miles east of Plant Gorgas. The nearest exposure of the Tuscaloosa aquifer system occurs in northwesternmost Walker County, approximately 30 miles northwest of Plant Gorgas. The Tuscaloosa aquifer system is not considered a primary source of groundwater in Walker County (Stricklin, 1989).

The Pottsville aquifer system is composed primarily of Pennsylvanian-aged sandstones, shales, conglomerates, and coal. Groundwater flow primarily occurs through coal seams or rock fabric discontinuities such as bedding planes and fractures. Groundwater in the Pottsville aquifer system is commonly regarded as confined due to large permeability contrasts within the aquifer (Stricklin, 1989). Recharge to the Pottsville formation is largely through infiltration of precipitation and to a lesser extent, downward seepage of river water at hydraulically favored locations.

Regionally, recharge is accommodated largely by fracture enhanced permeability. Major recharge zones to the Pottsville Formation are related to major geologic structures such as large fault zones or along systematic fold axes (Pashin, 2007). Although the Pottsville aquifer system is the primary aquifer in Walker County, groundwater use is relatively limited. According to O’Rear et al., 1972, groundwater use accounted for approximately 15% of total water use in Walker County in 1966. By 2005, groundwater use had declined to less than 1% of total water use in Walker County, or 1.14 million gallons per day (mgd) of groundwater out of a total water use of 969.5 mgd (USGS, 2005).

3.2.1 Pottsville Formation – Rock Chemistry

Published data indicate that elevated arsenic concentrations occur in the Southern Appalachian coal strata where site monitoring wells are screened. Numerous publications document elevated trace metals in Pottsville and Pottsville coal strata (Kolker et al., 1999, Diehl et al., 2004, Goldhaber et al., 2002). For instance, according to the USGS National Coal Data System (NRCDS), the average concentration of arsenic (72 parts per million (ppm)) in the Pottsville coal strata is three times that of the average of other coal basins (Bragg et al., 1997). Of the U.S. coal analyses for arsenic that are at least three standard deviations above the mean, approximately 90% are from the coal fields of Alabama (Diehl et al., 2004). The United States Geological Survey (USGS) maintains an inventory of coal quality that includes trace metal concentration data. It shows arsenic concentrations range from 1.08 milligrams per kilograms (mg/kg) to 611.0 mg/kg with a mean of 47 mg/kg for Walker County (USGS Coal Quality Database).

Similarly, 75 Pratt Coal Group samples (Pratt, Nickel Plate, and American coal seams) analyzed by the USGS and inventoried in the USGS National Coal Data System (NRCDS) showed the following ranges of other trace metals:

- Boron – 6.3 to 83.6 ppm (average of 35 ppm).
- Cobalt – 1.6 to 19.8 ppm (average of 8 ppm).
- Molybdenum – 0.8 to 22.2 ppm (average of 5 ppm).

- Lithium – 1.4 to 128 ppm (average of 28 ppm).

Bulk geochemical analyses of Pottsville stratigraphy from the Site and of the Pratt and American coal seams from Plant Gorgas were conducted on recovered core. The data reflect arsenic concentrations between 4.9 mg/kg and 32.6 mg/kg in siltstone/mudstones and concentrations of 28.9 and 384.4 mg/kg in two coal seams analyzed. The average arsenic concentration was roughly 34 mg/kg in these samples tested, which is in good agreement with data observed in the USGS Coal Quality Database.

Similarly, 17 Pratt Coal Group samples collected from the Site provided the following ranges of other trace metals:

- Boron – 20.8 to 114 ppm (average of 49 ppm).
- Cobalt – 4.2 to 18.2 ppm (average of 14 ppm).
- Molybdenum – 1.0 to 4.4 ppm (average of 2 ppm).

During the first part of 2022, a robust study of the composition of Pottsville Formation (Pratt, Gillespy, and Mine Spoil derivatives) at the nearby Plant Gorgas Gypsum Pond, found the following concentrations in rock and mine spoil materials:

- Lithium – 30 to 367 ppm (average of 128 ppm).
- Arsenic – 7 to 79 ppm (average of 32 ppm).
- Molybdenum – 0.67 to 9.8 ppm (average of 3 ppm).

Trace metal enrichment and pyrite origins have been linked to post-depositional (post-coalification) deformation and trace metal laden hydrothermal fluids upwelling during Alleghanian tectonism. Diehl et al., (2004) and Goldhaber et al., (2002) describe “high-pyrite” coals as a source of elevated arsenic and other trace metals. In these publications, pyrite occurrence is observed within coal banding, woody cellular fill structures, mineral overgrowths, and structural fills such as veins and microfaults. The geogenic lithium study at the Plant Gorgas Gypsum Pond (July 2022), observed strong correlations between mica and clay mineral abundance and lithium concentrations as well as secondary lithium associated primarily with sorption on iron oxides.

In areas where strip mining occurred (north of ash pond dam, west of the ash pond), the process of strip mining and backfilling these materials can increase the availability of trace metals to groundwater. These mining processes and practices lead to the physical weakening and enhanced weathering of rock which along with changed hydrodynamics can lead to elevated and highly variable concentrations across a historic

mine site. Increased acidity in groundwater, when present, can also help to mobilize constituents – especially in mine spoil materials.

3.2.2 Uppermost Aquifer

The Pottsville aquifer system is the uppermost aquifer beneath the site for groundwater monitoring purposes. Groundwater occurs in the Pratt Coal Group of the Upper Pottsville Formation at the site. The primary occurrences of groundwater in the uppermost aquifer are: (1) coal seams, (2) rock fractures or zones of fracture enhanced permeability, and to a lesser extent (3) bedding planes. Fractured intervals are sparse across the site as defined by caliper logging and tend to occur with greater density in the upper 100 feet of rock.

Groundwater yield at the site is considered low and typical of the Pottsville aquifer system in areas without major geologic structures. Wells were generally screened in the Pratt coal seam or across groundwater yielding fractures. Depth to groundwater producing zones were highly variable at the site and typically ranged from 30 to 240 feet BGS. Caliper, natural gamma, normal resistivity, fluid temperature, fluid resistivity logs, and heat pulse flowmeter logs were used to determine groundwater yielding zones. Packer testing was used in select borings to further enhance characterization.

Based on published data, groundwater quality produced from the Pottsville Formation can be characterized by high concentrations of sulfate, iron, and other trace metals (Jennings and Cook, 2010). Trace metals in Pottsville Formation groundwater are associated with sulfide minerals contained in organic-rich strata (e.g., mudstones and coal seams) and siliceous/carbonate healed fractures and joints. Trace element enrichment is the result of migrating hydrothermal fluids generated during the late Paleozoic Allegheny orogeny (Diehl et al., 2004). Arsenic, antimony, molybdenum, selenium, copper, thallium, and mercury are elevated in Warrior Basin coal strata (Goldhaber et al., 2002).

3.2.3 Flow Interpretation

Groundwater flow is accomplished primarily by means of fracture flow, where groundwater flows along more conductive secondary discontinuities in the rock mass such as joints or cleat fabric in coal seams. Fracture flow in complex geologic media such as the heterogenous Pottsville Formation can be complex. Groundwater in the Pottsville aquifer is most commonly regarded as confined due to large permeability contrasts within the aquifer (Stricklin, 1989). The Pottsville at the Site is probably better described as a series of discrete, confined to semi-confined, groundwater yielding zones where groundwater elevations

can vary significantly laterally and vertically and are governed by the heterogeneity of the lithology and degree of fracture network interconnectivity.

At the Site, the groundwater flow regime is now grouped into three general flow systems: (1) shallow water-table flow system, (2) Pratt Coal flow system, and (3) American Coal flow system. At higher stratigraphic intervals (water-table flow system), groundwater flows towards the Ash Pond or other surface water bodies. This flow system is driven by gravity and mimics the topography of the site. Within deeper rock strata such as coals of the Pratt Group (Pratt Coal Group or deep bedrock flow system), groundwater flows radially away from the site.

Based on structural elevations and dip, the American coal seam would intercept the base of the pond between the ash pond and splitter dike and the Pratt coal seam would intercept the base of the pond near its' geographic center proximal to wells GS-AP-MW-12 and GS-AP-MW-1. The more permeable coal measures underlie the northern half of the ash pond before dipping below its' base towards the south (the southern half of the ash pond is underlain by mudstone/shale interval). Radial flow is interpreted to emanate proximal to this intersection.

Except for the far northern portion of the Ash Pond, conceptually, there is likely to be little hydraulic communication with strata deeper than the sandstone unit immediately underlying the American Coal Seam (American Coal Flow System). Below this interval, a low permeability mudstone to interbedded mudstone-sandstone unit likely forms a barrier to vertical migration of groundwater as hydraulic conductivity values in the 10^{-7} centimeter per second (cm/s) range are reported for shales at the site as derived from packer testing. This interval reflects the transition to Gillespy Coal Group.

However, to the north and underlying the Ash Pond dam, strong hydraulic gradients likely force groundwater along vertical fractures and bedding planes through the upper part of the Gillespy Coal Group. Geophysical and hydrophysical logs obtained in well locations north of the dam suggest that three to four discrete bedding planes occurring between 30 and 90 ft BGS transmit groundwater. The most prominent typically occurring at a depth of 49 to 56 ft BGS (likely Gillespy equivalent; approximately 100 feet below American Coal Seam). These discrete zones occur in the upper part of the Gillespy Coal Group and appear to dip approximately 2.1° southwest. Geophysical signatures of flow diminish greatly in between and below these intervals. Failed attempts at deeper well locations along with the geophysical logs suggest little or no groundwater flow at elevations below 160 feet MSL. Strong upward vertical gradients are observed in paired well locations (see groundwater elevations in MW-6S/6D and MW-41HS/HD pairs) installed north of the ash pond dam. Potentiometric data suggests upward vertical flows along with northerly lateral flow.

Forty-three packer tests were conducted resulting in a range of hydraulic conductivity (k) values from an estimated low of 7×10^{-7} cm/sec to a high of 4×10^{-3} cm/sec, with most tests (31) in the moderate range (10^{-5} cm/sec to 10^{-4} cm/sec), two test results in the more permeable range (10^{-3} to 10^{-2} cm/sec), and ten test results in the less permeable range (10^{-6} cm/sec). There is a general trend of decreasing estimated hydraulic conductivity with depth. Packer test results vary over 4 orders of magnitude. Test intervals at the high end of the data range are associated with weathered discontinuities (fractures/joints). Moderate values are associated with minor fractures or bedding planes. The lowest values are associated with more shale intervals without substantial fractures. Test intervals with coal seams are in the moderate to high end of the data range.

3.3 GROUNDWATER MONITORING SYSTEM

Pursuant to 40 CFR § 257.91 and ADEM Admin. Code r. 335-13-15-.06(2), Plant Gorgas has installed a groundwater monitoring system to monitor groundwater within the uppermost aquifer. The certified groundwater monitoring system for the Plant Gorgas Ash Pond is designed to monitor groundwater passing the waste boundary of the CCR unit within the uppermost aquifer. Wells were located to serve as upgradient, and downgradient monitoring locations based on groundwater flow direction as determined by the potentiometric surface elevation contour maps. All groundwater monitoring wells were designed and constructed using “Design and Installation of Groundwater Monitoring Wells in Aquifers,” ASTM Subcommittee D18.21, as a guideline.

3.3.1 Monitoring Wells

Well locations at the site are designated as upgradient, downgradient, piezometer (water-level only), vertical delineation, and horizontal delineation. The following subsections provide a summary of well designations and if applicable, changes or modifications to the well network or designations. As described in the site Groundwater Monitoring Plan, modifications to the well network or designation must first be approved by ADEM.

The location and designation of Site wells are presented in **Figure 5, Monitoring Well Location Map.**

3.3.1.1 Upgradient Wells

To evaluate upgradient well locations at the Site, groundwater elevations and CCR indicator parameters were reviewed. As described in **Section 3.2.3**, there are multiple groundwater flow regimes within the Pottsville Formation at the Site: (1) an upper groundwater flow system found at higher elevations (water-

table flow system) and (2) a deeper groundwater flow system composed of Pratt Coal Group strata that also represents the uppermost aquifer beneath the Ash Pond.

Historically, two upgradient well locations (GS-AP-MW-8 and GS-AP-MW-13) screened in the upper groundwater flow system have been used for statistical comparison of groundwater quality. The upper groundwater flow system corresponds to younger or recharging groundwater and groundwater elevations are greater than those of the Ash Pond. Groundwater flows towards the Ash Pond or other surface water bodies. Spatially, these locations are among downgradient compliance wells but are screened across fractures that occur at higher elevations and are not hydraulically connected to downgradient flow away from the Ash Pond.

Appendix III (detection monitoring parameters) constituent concentrations, along with select other Appendix IV CCR indicator parameters, were also evaluated as further basis for designating locations GS-AP-MW-8 and GS-AP-MW-13 as upgradient. In general, concentrations of CCR indicator parameters reported for these well locations are well below published Groundwater Protection Standards (GWPS), downgradient wells, and pore-water (source) concentrations. The absence of elevated concentrations of CCR indicator parameters indicates younger, recharging groundwater and groundwater that has not been impacted by groundwater flowing away from the Ash Pond. The data, along with groundwater elevation data, support an upgradient designation for locations GS-AP-MW-8 and GS-AP-MW-13. Upgradient location GS-AP-MW-13 was abandoned in 2019. Historical data collected from this location will still be used for statistical comparison of groundwater quality data.

Location GS-AP-MW-17V was originally intended for vertical delineation but was screened at a higher elevation due to encountering the underlying Maxine Mine at depth and identifying more shallow groundwater flow. Groundwater elevations at GS-AP-MW-17V indicate this location is upgradient of the Ash Pond with groundwater elevations roughly 35 feet higher than the Ash Pond. This location was proposed as an additional upgradient location in an updated Groundwater Monitoring Plan submitted to ADEM in April 2020 (revised August 2020 and March 2021).

During the Fall of 2021, replacement monitoring well GS-AP-MW-18R was installed across a shallow water-bearing fracture. Initial groundwater elevations demonstrate that this well location is most suitable as an upgradient well location.

| Indicator Parameter Comparison | | | | | | | | |
|---|---------|---------|----------|---------|------|-------|---------|---------|
| Average Groundwater Concentration(s) By Hydrogeologic Unit/Category | | | | | | | | |
| Hydrogeologic Unit/Category | Boron | Calcium | Chloride | Sulfate | TDS | pH | Arsenic | Lithium |
| Potential Upgradient | | | | | | | | |
| GS-AP-MW-17V | 0.04322 | 30.9 | 3.6 | 11.1 | 361 | 7.61 | 0.00216 | 0.06500 |
| GS-AP-MW-16S | 0.07487 | 13.8 | 4.7 | 5.9 | 426 | 10.10 | 0.00231 | 0.07500 |
| Source Water | | | | | | | | |
| Ash | 4.02 | 143.3 | 8.2 | 282.3 | 594 | | 0.30033 | 1.09667 |
| By Major Hydrogeologic Unit (All Wells) | | | | | | | | |
| Pottsville Fm - American Strata | 0.07124 | 44.3 | 86.7 | 286.3 | 837 | 7.81 | 0.00522 | 0.08375 |
| Pottsville Fm - Gillespy Transition | 0.97841 | 46.4 | 9.7 | 139.8 | 403 | 7.16 | 0.10266 | 0.17827 |
| Pottsville Fm - Pratt Strata | 0.19656 | 29.7 | 16.2 | 81.1 | 426 | 8.64 | 0.00991 | 0.09119 |
| By Major Hydrogeologic Unit (Wells Demonstrating SSLs) | | | | | | | | |
| Pottsville Fm - American Strata | 0.08373 | 56.6 | 281.1 | 783.3 | 2008 | 8.06 | 0.01010 | 0.14625 |
| Pottsville Fm - Gillespy Transition | 0.96606 | 26.2 | 12.0 | 166.4 | 446 | 7.32 | 0.14667 | 0.12667 |
| Pottsville Fm - Pratt Strata | 0.44006 | 40.9 | 19.9 | 168.9 | 560 | 9.32 | 0.01706 | 0.20397 |

The above comparison presents average concentrations of key indicator parameters and grouped by (1) potential upgradient wells as defined by groundwater elevations, (2) ash pore water that represents a potential source composition for groundwater impacts, (3) downgradient wells by hydrogeologic unit, and (4) wells demonstrating exceedances by hydrogeologic unit. This profile shows that potential upgradient wells demonstrate a lower concentration profile for boron, calcium, chloride, sulfate, TDS, arsenic, and lithium. Well GS-AP-MW-16S has demonstrated elevated pH which profiles favorably as a comparable upgradient location for GS-AP-MW-15 and GS-AP-MW-21 which have also demonstrated elevated pH.

Additional data will be collected from GS-AP-MW-16S prior to making a final recommendation. Well GS-AP-MW-17V has been incorporated as an upgradient well and data used for determination of groundwater protection standards during the Fall 2021 sampling event.

Table 1a, Compliance Monitoring Well Network Details, summarizes compliance well installation data, including monitoring well construction details and the lithology (flow system) adjacent to the screened interval

3.3.1.2 Downgradient Wells

Borehole geophysics, hydrophysical logging, and occasional packer testing were used to determine well screen intervals. These logging techniques identify groundwater flow zones in open boreholes and are optimally suited for use in low-yielding, fractured rock media. Heat-pulse flowmeter logging or packer testing were often used to assess or further evaluate flow zones indicated by hydrophysical logging tools. If multiple flow zones were identified, then paired wells were often installed to screen both zones.

Preferential groundwater flow away from the site, if existing, would occur within zones of enhanced permeability such as cleated coals or zones of intersecting rock discontinuities spatially located lateral to or beneath the base of the Ash Pond. Strata of the Pratt Coal Group are the uppermost aquifer lateral to or beneath the base of the Ash Pond, as indicated by borehole logging and geophysics. Downgradient monitoring wells are installed in the Pratt Coal Group, and generally across the Pratt or American Coal Seam.

To the north and beneath the Ash Pond dam, Pratt Coal Group strata exist above the ground surface or are mined out. In these areas, downgradient monitoring well locations were installed across the uppermost groundwater yielding fractures identified by borehole geophysics and hydrophysical logging and generally correspond to the transition from Pratt to Gillespy Coal Groups.

Downgradient locations GS-AP-MW-9, GS-AP-MW-10, GS-AP-MW-11, GS-AP-MW-13, and GS-AP-MW-14 were abandoned in 2019.

Former downgradient piezometer GS-AP-MW-3 was sampled during the first semi-annual sampling event of 2021. As discussed in the *2020 Annual Groundwater Monitoring and Corrective Action Report*, a low-yield study (re-evaluation of recharge rate versus depth and field parameters) found that well location GS-AP-MW-3 produced sufficient yield for low-flow sampling methods. It is uncertain if GS-AP-MW-3 will produce sufficient yield year-round or only during the wet season months. Recharge rates and analytical data will be evaluated over subsequent sampling events to determine if this location is suitable as a long-term downgradient compliance well. Presently, the well is being treated as a downgradient location while these data can be evaluated.

During the Fall of 2021, several delineation wells were re-designated as downgradient compliance wells to satisfy compliance monitoring needs in the American Flow System. These wells include GS-AP-MW-9V, GS-AP-MW-12V, GS-AP-MW-15V, GS-AP-MW-21V.

Additional downgradient compliance monitoring wells were installed during the Fall of 2021 as well. These locations include GS-AP-MW-1R, GS-AP-MW-3V, GS-AP-MW-5R, GS-AP-MW-9R, GS-AP-MW-10R, GS-AP-MW-11R, GS-AP-MW-13R, GS-AP-MW-18VR, GS-AP-MW-46, and GS-AP-MW-47. Well construction details and screened lithologies for downgradient wells are summarized in **Table 1a**.

3.3.1.3 Delineation Wells

Pursuant to 40 CFR § 257.95(g)(1), ADEM Admin. Code r. 335-13-15-.06(6)(g)2., and AO 18-096-GW, additional monitoring wells have been installed to characterize the horizontal and vertical extent of GWPS exceedances identified during assessment monitoring. Three phases of field investigation have occurred since late 2018 to explore potential impacts to groundwater.

Three historic piezometers, GS-AP-PZ-16, GS-AP-PZ-18, and GS-AP-PZ-22 monitor water levels in the adjacent Maxine Mine (American coal seam). These locations were converted to vertical delineation wells during the first quarter of 2020. Well GS-AP-PZ-18 was abandoned in the Fall of 2021 to accommodate ash pond closure activities.

Former piezometer, GS-AP-MW-41HS, was sampled during the first semi-annual sampling event of 2021. As discussed in the *2020 Annual Groundwater Monitoring and Corrective Action Report*, a low-yield study (re-evaluation of recharge rate versus depth and field parameters) found that well location GS-AP-MW-41HS produced sufficient yield for low-flow sampling methods. It is uncertain if GS-AP-MW-41HS will produce sufficient yield year-round or only during the wet season months.

During the Fall of 2021, four additional delineation wells were installed to assess potential groundwater impacts. These wells include GS-AP-MW-23V, GS-AP-MW-27HR, GS-AP-MW-37HR, and GS-AP-PZ-18R.

Delineation well locations are presented in **Figure 5. Table 1b, Delineation Well Network Details**, summarizes delineation well installation data, including monitoring well construction details and the lithology (flow system) adjacent to the screened interval.

3.3.1.4 Piezometers

There are currently 7 piezometers at the site. Historically, water-level only piezometers are well locations that (1) did not yield sufficient groundwater recharge for sampling or (2) encountered underground mine workings not suitable for compliance sampling. **Table 1c, Piezometer Well Network Details**, summarizes

piezometer installation data, including piezometer construction details and the lithology (flow system) adjacent to the screened interval.

A study and re-analysis of low-yielding piezometers (GS-AP-MW-1, GS-AP-MW-3, GS-AP-MW-4, GS-AP-MW-7V, GS-AP-MW-16S, GS-AP-MW-20, GS-AP-MW-27H, GS-AP-MW-30H, GS-AP-MW-30HS, GS-AP-MW-37H, GS-AP-MW-39H, and GS-AP-MW-41HS) was conducted to assess potential for sampling and inclusion into the monitoring well network. This study revealed that two locations, GS-AP-MW-3 (downgradient) and GS-AP-MW-16S (upgradient), produce sufficient groundwater yield (at least seasonally) to be proposed for inclusion into the site groundwater monitoring network. Results and discussion of the low-yield study was included in the *2020 Annual Groundwater Monitoring and Corrective Action Report* and are only summarized above for the purposes of this report. The proposed re-designation of these well locations were also included in the *March 2020 Revised Groundwater Monitoring Plan (GWMP)* (see *Table 1 of March 2020 GWMP*).

Location GS-AP-MW-16S was also proposed as an additional upgradient location in the Groundwater Monitoring Plan submitted in March 2021. At this time, it is unknown if well GS-AP-MW-16S will provide sufficient groundwater year-round or only seasonally during wetter periods. The following lines of evidence provide support for an upgradient designation:

- (1) Groundwater elevations and flow pattern consistent with uppermost Water-Table Aquifer System (see **Sections 3.2.3** and **4.1** for detailed discussion of groundwater elevation and flow). This indicates that groundwater flow away from GS-AP-MW-16S is towards the ash pond and vertically downward, indicating upgradient conditions.
- (2) Low concentrations of key Appendix III indicator parameters.

Although approved as a potential upgradient well, the plan is to continue to evaluate data from GS-AP-MW-16S prior to final recommendation. Geochemically, GS-AP-MW-16S shares common traits with wells GS-AP-MW-15, GS-AP-MW-15V, and GS-AP-MW-21 (elevated and correlating - pH, lithium).

Piezometer locations are presented in **Figure 5**.

3.3.1.5 Monitoring Well Replacement and Abandonment

As described in preceding sections numerous well replacements and well replacement activities occurred during the Fall of 2021. Replacement wells installed, surveyed, and developed include compliance replacement locations: GS-AP-MW-1R, GS-AP-MW-5R, GS-AP-MW-9R, GS-AP-MW-10R, GS-AP-MW-11R, GS-AP-MW-13R, GS-AP-MW-14R, GS-AP-MW-18R, and GS-AP-MW-18VR. Original

locations were abandoned in 2019 and 2021 to allow for the progress of ash pond closure activities. Information related to well construction details and screened lithology can be found in **Table 1a**.

Additional compliance wells were also installed. These include GS-AP-MW-3V, GS-AP-MW-46, and GS-AP-MW-47. Information related to well construction details and screened lithology can be found in **Table 1a**. Additional or replacement delineation wells were also installed during the Fall of 2021. These locations included: GS-AP-MW-23V, GS-AP-MW-27HR, GS-AP-MW-37HR, and GS-AP-MW-PZ-18R. Information related to well construction details and screened lithology can be found in **Table 1b**.

Table 1d, Abandoned Well Network Details summarizes well construction details and screened lithology of wells abandoned at the Site.

3.4 GROUNDWATER MONITORING HISTORY

In accordance with § 257.94(b), eight independent samples were collected from each background and downgradient well and analyzed for the constituents listed in Appendix III and IV prior to October 17, 2017. Background sampling was performed over the period of August 2016 to June 2017. Groundwater sampling for the first detection monitoring event after the background period was performed in August 2017.

Based on results of the 2017 Annual Groundwater and Corrective Action Monitoring Report, Alabama Power initiated an assessment monitoring program on January 15, 2018. Pursuant to 40 CFR §257.95(a) and ADEM Admin. Code r. 335-13-15-.06(6)(a), monitoring wells were sampled for all Appendix IV parameters in February 2018, within 90 days of initiating the assessment monitoring program.

Statistical evaluations of 2018 assessment monitoring data identified SSLs of Appendix IV constituents above the GWPS, and the Site entered Assessment of Corrective Measures. Pursuant to 40 CFR §257.95(g)(1), ADEM Admin. Code r. 335-13-15-.06(6)(g)2., and AO 18-096-GW, additional monitoring wells (**Table 1c, Figure 5**) were installed to characterize the horizontal and vertical extent of GWPS exceedances identified during assessment monitoring in three phases of groundwater investigations between January 2019 and September 2020. These wells, along with the compliance monitoring well network, are sampled semi-annually.

Delineation wells installed at the Site have been sampled concurrently with the compliance monitoring well network beginning with the second semi-annual sampling event in September 2020. However, occasionally,

additional data collection has occurred independent of routine compliance sampling events to support continuing assessment activities at the Site.

3.4.1 Available Monitoring Data

Laboratory analytical data is available for the groundwater monitoring history outlined in **Section 3.4**. Tabulated results for Appendix III and Appendix IV constituents by monitoring well are included in **Appendix A, Analytical Data Summary**.

3.4.2 Historical Groundwater Flow

Historical groundwater elevations and potentiometric surface maps show that groundwater flow patterns are consistent across monitoring events and as described in **Section 3.2.3**. As ash pond closure activities progress over the years and upon completion of closure, groundwater elevations will likely display variability representative of changing site hydrodynamics and eventually, a new set of equilibrium conditions. As this timeline progresses, groundwater elevations and trends will be qualitatively reviewed against this historical data set.

Tables summarizing groundwater elevations from all groundwater monitoring events are included in **Appendix B, Historical Groundwater Elevations Summary**.

3.4.3 Monitoring Variances

The groundwater monitoring program at the Site is operating under a Variance granted by ADEM on April 15, 2019, to conform State monitoring requirements under the CCR rule to Federal requirements. The variance:

1. Retains boron as an Appendix III detection monitoring parameter and excludes it as an Appendix IV assessment monitoring parameter.
2. Authorizes the use of Federally-published GWPS of 0.006 milligrams per liter (mg/L) for cobalt, 0.015 mg/L for lead, 0.040 mg/L for lithium, and 0.100 mg/L for molybdenum in lieu of background where those levels are greater than background levels.

3.5 GROUNDWATER SAMPLING AND ANALYSIS

Site compliance wells are sampled semi-annually between: (1) late winter – mid spring and (2) early to late fall. The temporal spacing between sampling events is sufficient to ensure that sampling events yield

independent groundwater samples and, represent different climatic or meteorological seasons which often foster a degree of natural variability in groundwater quality.

During routine semi-annual monitoring events, all compliance and delineation network wells are sampled and analyzed for Appendix III and Appendix IV constituents. Additional general chemistry constituents (major ions and anions) are now being collected routinely as well. These non-compliance parameters will be periodically analyzed to explore seasonal or closure-related changes to geochemical facies to site groundwater.

The following subsections summarize the sequential steps and process for the sampling, handling/transport, and analysis of compliance-related groundwater samples at the Site.

3.5.1 Groundwater Sample Collection

Prior to recording water levels and collecting samples, each well was opened and allowed to equilibrate to atmospheric pressure. Within a 24-hour period, depths to groundwater were measured to the nearest 0.01 foot with an electronic water level indicator with depth referenced from the top of the inner PVC well casing. Groundwater elevations were calculated by subtracting the depth to groundwater from surveyed top-of-casing (TOC) elevations.

Groundwater samples were collected from monitoring wells using low-flow sampling procedures in accordance with § 257.93(a) and ADEM Admin. Code r. 335-13-15-.06(4)(a). All monitoring wells in the compliance well network are equipped with dedicated pumps. Monitoring wells were purged and sampled using low-flow sampling procedures. In this procedure, field water quality parameters (pH, turbidity, conductivity, and dissolved oxygen) are measured to determine stabilization and groundwater samples are collected when the following stabilization criteria are met:

- 0.2 standard units for pH.
- 5% for specific conductance.
- 0.2 mg/L or 10% for DO > 0.5 mg/l (whichever is greater).
- Turbidity measurements less than 5 NTU.
- Temperature and ORP – record only, no stabilization criteria.

During purging and sampling, an In-Situ Aqua Troll instrument was used to monitor and record field parameters. Once stabilization was achieved, samples were collected and submitted to the laboratory

following standard chain-of-custody (COC) protocol. Field data recorded in support of groundwater sampling activities are included in **Appendix C, Laboratory and Field Records**.

3.5.2 Sample Preservation and Handling

Groundwater samples were collected within the designated size and type of laboratory-supplied containers required for specific parameters. Sample bottles were pre-preserved by the laboratory.

Where temperature control was required, samples were placed in an ice-packed cooler and cooled to less than 6 °C immediately after collection. Blue ice or other cooling packs were not used for cooling samples. An ice-packed cooler was on hand when samples were collected.

3.5.3 Chain of Custody

A COC record was used to track sample possession from the time of collection to the time of receipt at the laboratory. COC records are included with the analytical laboratory reports included in **Appendix C**.

3.5.4 Laboratory Analysis

Laboratory analyses were performed by the APC Environmental Laboratory (APCEL) in Calera, Alabama and Pace Analytical Services, LLC (Pace). Both APCEL and Pace are accredited by National Environmental Laboratory Accreditation Program (NELAP) and maintain a NELAP certification for all parameters analyzed. **Table 2, Parameters and Reporting Limits**, lists monitoring constituents analyzed from site groundwater samples. Lab reports and chain of custody records for the monitoring period are presented in **Appendix C**.

3.5.5 Monitoring Period Sampling Events

As required by § 257.90(e) and ADEM Admin. Code r. 335-13-15-.06(1)(e), the following describes monitoring-related activities performed during the specified monitoring period. The first semi-annual monitoring event took place between February 7, 2022, and March 4, 2022. A re-sampling event for combined radium took place between May 9th and May 12th, 2022, for select wells where outliers were suspected. This re-sample included wells:

- GS-AP-MW-16S
- GS-AP-MW-17V
- GS-AP-MW-25HA

- GS-AP-MW-36H

The second semi-annual monitoring event took place between July 18, 2022, and August 11, 2022.

Groundwater samples were analyzed for the full list of Appendix III and Appendix IV parameters during the monitoring event. During the 2022 sampling events, additional general chemistry and monitored natural attenuation monitoring parameters were sampled and analyzed. These analytes have been incorporated for continued evaluations of geochemical facies and their evolution over time. These analytes will also support geochemical modeling and evaluations associated with monitored natural attenuation. These parameters include:

- Calcium (filtered)
- Iron (total and dissolved)
- Silicon (total and dissolved)
- Silica (total and dissolved)
- Sodium (total and dissolved)
- Sulfide
- Potassium
- Aluminum (total and dissolved)
- Manganese
- Magnesium (total and filtered)
- Nitrate-Nitrite
- Total Alkalinity, Carbonate Alkalinity, Bicarbonate Alkalinity
- Total Organic Carbon.

All groundwater sampling activities were conducted by APC Field and Water Services. Pace Analytical Services (Greensburg) performed the laboratory analyses of Radium-226 and Radium-228 (reported combined) as well as the MNA parameter sulfide (Pace – New Orleans). APCEL performed the remaining Appendix III and Appendix IV analyses. Analytical data from the groundwater monitoring events is included as **Appendix C** in accordance with the requirements of § 257.90(e)(3) and ADEM Admin. Code r. 335-13-15-.06(1)(f)3.

4.0 GROUNDWATER ELEVATIONS AND FLOW

During the first semi-annual sampling event, groundwater elevations ranged from 128.22 to 534.75 ft MSL. feet NAVD88 (feet above reference 1988 North American Vertical Datum). **Figure 6A, Potentiometric Surface Contour Map (February 7, 2022) – Water Table, Figure 6B, Potentiometric Surface Contour Map (February 7, 2022) - Pratt Aquifer, and Figure 6C, Potentiometric Surface Contour Map (February 7, 2022) - American Aquifer** depict groundwater elevations and inferred groundwater flow direction during the first semi-annual sampling event of 2022.

During the second semi-annual sampling event, groundwater elevations ranged from 132.98 to 534.77 ft MSL. feet NAVD88 (feet above reference 1988 North American Vertical Datum). **Figure 7A, Potentiometric Surface Contour Map (July 18, 2022) – Water Table, Figure 7B, Potentiometric Surface Contour Map (July 18, 2022) - Pratt Aquifer, and Figure 7C, Potentiometric Surface Contour Map (July 18, 2022) - American Aquifer** depict groundwater elevations and inferred groundwater flow direction during the second semi-annual sampling event of 2022.

The obtained depth to water readings and calculated groundwater elevations for piezometers, GS-AP-MW-7V and GS-AP-MW-39H, are reflective of effectively dry piezometers. These wells did not encounter groundwater yielding intervals in the Gillespy and beneath the American coal flow system.

Figures 6A/7A shows groundwater flow towards the Ash Pond in wells screened in the upper flow system and towards Mulberry Fork in the middle to lower portions of the flow system. **Figures 6B/7B** show radial groundwater flow away from the Ash Pond in the Pratt Coal flow system. **Figures 6C/7C** show groundwater flow away from the Ash Pond in the deeper American Coal seam flow system. Recent groundwater elevation data have been tabulated and included in **Table 3, Groundwater Elevation Summary**. All historical available groundwater elevation data recorded since 2016 have been tabulated and included in **Appendix B**.

No significant changes in groundwater elevations or flow have been noted at the site as ash pond dewatering activities have not been initiated.

4.1 GROUNDWATER ELEVATION CHANGES

Groundwater elevations in multiple well locations have been identified as potential lower bound outliers based upon historical groundwater elevation data and screening with Interquartile Range (1.5 x IQR) statistics. While no significant groundwater flow pattern changes have been noted, these findings suggest

that (1) active de-watering of the ash pond might be leading to detectable changes in groundwater levels and (2) resumed mining activity to the south (likely dewatering operations) may have had a pronounced impact on decreasing groundwater elevations observed during the second semi-annual sampling event of 2022. Resumed mining activity has not been confirmed at the time of publication.

Following the second semi-annual monitoring event (July 2022), groundwater elevation data screened provided statistically significant decreases from historical records. A review of groundwater elevation data identified 17 well locations displaying groundwater elevations below the lower bound threshold. Eleven well locations displayed moderate to significant declines and are presented below.

| Well | Lowerbound GW Elevation Threshold (IQR) | GW Elevation 7/18/2022 | Distance below Lowerbound GW Elevation |
|---------------|---|------------------------|--|
| GS-AP-MW-34HO | 262.86 | 252.45 | -10.41 |
| GS-AP-PZ-16 | 258.76 | 252.45 | -6.31 |
| GS-AP-PZ-22 | 257.77 | 252.42 | -5.35 |
| GS-AP-MW-21V | 329.47 | 324.13 | -5.34 |
| GS-AP-MW-21 | 339.05 | 335.17 | -3.88 |
| GS-AP-MW-15V | 289.22 | 285.35 | -3.87 |
| GS-AP-MW-35HO | 285.42 | 282.35 | -3.07 |
| GS-AP-MW-2 | 374.97 | 371.91 | -3.06 |
| GS-AP-MW-36H | 291.36 | 288.45 | -2.91 |
| GS-AP-MW-3 | 373.47 | 370.63 | -2.83 |
| GS-AP-MW-12 | 379.28 | 376.59 | -2.69 |
| GS-AP-MW-30HA | 254.33 | 252.32 | -2.01 |
| GS-AP-MW-32H | 279.39 | 277.84 | -1.55 |
| GS-AP-MW-20 | 310.11 | 308.77 | -1.34 |
| GS-AP-MW-33HO | 272.87 | 271.89 | -0.98 |
| GS-AP-MW-43H | 363.21 | 362.51 | -0.70 |
| GS-AP-MW-31H | 350.71 | 350.18 | -0.53 |

The most significant groundwater elevation decreases observed during the July 2022 monitoring event are spatially clustered to the south with the densest cluster occurring south and west of the southern edge of the Ash Pond. Here wells tapping the American coal seam or American Maxine Mine (GS-AP-MW-34HO, GS-AP-PZ-16, GS-AP-PZ-22) demonstrate the highest order of decrease. This spatial pattern suggests that mining operations have resumed southwest or south-southwest of the Site. Additionally, pond closure

activities may also be contributing to decreases observed – especially in wells located further north. Dewatering operations began at the Site in 2022.

4.2 GROUNDWATER FLOW VELOCITY CALCULATIONS

Because the geology at the Ash Pond is not homogeneous or isotropic with respect to groundwater flow, groundwater velocity calculations using derivations of Darcy’s Law are not applicable to groundwater at the site. The hydrogeologic characteristics of fractured rock typically produce preferential groundwater flow paths, so groundwater velocity is much more variable than in uniform porous media such as sand. During monitoring well installation, multiple techniques were used to successfully intercept groundwater flow paths with the monitoring wells located around the Ash Pond. These flow paths correspond to coal cleats and fractures, zones of fracture concentration, bedding planes, and other discontinuities in the rock. Therefore, groundwater flow velocity at the site cannot be accurately quantified using existing site data.

Slug testing provided horizontal hydraulic conductivities for the uppermost aquifer between 1.19×10^{-3} cm/sec and 1.22×10^{-5} cm/sec with an average of 4.52×10^{-4} cm/sec. A total of 43 packer tests resulted in a range of hydraulic conductivity (k) values from an estimated low of 7×10^{-7} cm/sec to a high of 4×10^{-3} cm/sec, with most tests (31) in the moderate range (10^{-5} cm/sec to 10^{-4} cm/sec), 2 test results in the more permeable range (10^{-3} to 10^{-2} cm/sec), and 10 test results in the less permeable range (10^{-6} cm/sec).

5.0 EVALUATION OF GROUNDWATER QUALITY DATA

During each sampling event, quality assurance/quality control samples (QA/QC) are collected at a rate of one sample per every group of 10 well samples. These QA/QC samples include well duplicates, equipment blanks, and field blanks. Routine analyses of field QA/QC samples are a method for evaluating whether artificial bias could have been introduced into lab results by ways of sampling activities or equipment.

5.1 DATA VALIDATION – QUALITY ASSURANCE/QUALITY CONTROL

Analytical precision is measured through the calculation of the relative percent difference (RPD) of two data sets generated from a similar source. Here, a comparison of results between samples and field duplicate samples are used as measure of laboratory precision. Where field duplicates are collected, the RPD between the sample and duplicate sample is calculated as:

$$RPD = \frac{Conc1 - Conc2}{(Conc1 + Conc2)/2}$$

Where:

RPD = Relative Percent Difference (%)

Conc1 = Higher concentration of the sample or field duplicate

Conc2 = Lower concentration of the sample or field duplicate

Where the relative percent differences are below 20%, the difference is considered acceptable and no further action is needed. Where an RPD is greater than 20%, further evaluation is required to attempt to determine the cause of the difference and potentially result in qualified data. **Table 4a, Relative Percent Difference Calculations**, provides the relative percent differences for sample and sample duplicates during the monitoring period. Two RPD criteria failures were observed during the first semi-annual sampling event: (1) GS-AP-MW-24H for sulfate and (2) GS-AP-MW-28H for fluoride. One RPD criteria failure was observed during the second semi-annual sampling event – molybdenum at location GS-AP-PZ-18R. In all instances of RPD criteria failure results reviewed were less than 5 times the RL. In these instances, a validation flag of (+) J, (ND), UJ can be applied to the original samples.

Analytical data reviewed provided low-level or trace detections in field and/or equipment blanks during the monitoring period. **Table 4b, Field QC: Blank Detections** provides a summary of low-level detections observed during the first semi-annual monitoring event. Each of these detections were estimated concentrations, above the MDL but below the RL, and qualified in the laboratory analytical reports with “J flags.” However, if concentrations are detected above the MDL in field QC samples, original results on the (1) date of a blank detection and (2) with a value less than 5 times the field QC detection are flagged with a (+) U* and MDL/RL values modified based upon the blank concentration.

Validated flags do not have an impact on possible statistical analyses due to: (1) low-level concentrations flagged during validation and/or (2) constituents flagged are not Site COI. The extent of trace chromium detections in blanks can be explained by a low MDL value of 0.000203 mg/L.

5.2 STATISTICAL METHODOLOGY AND TESTS

Sanitas software is used to perform statistical analyses on Site data. Sanitas is a decision support software package that incorporates the statistical tests required of Subtitle C and D facilities by EPA regulations. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015) as well as with the USEPA Unified Guidance (2009).

5.2.1 Appendix III Evaluation

Interwell prediction limits, combined with a 1-of-2 verification strategy, are used to evaluate boron, calcium, chloride, fluoride, sulfate, and TDS. Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The most recent sample from each downgradient well is compared to the background limit to identify SSIs.

Groundwater Stats Consulting demonstrated that these test methods were appropriate in the October 2017 Statistical Analysis Plan, which was updated in August 2020 with additional data screening and evaluation. Time series plots were used to screen proposed background data for suspected outliers, or extreme values that would result in limits that are not conservative from a regulatory perspective. Suspected outliers at all wells for Appendix III parameters are formally tested using Tukey’s box plot method and, when identified, flagged in the computer database.

The following adjustments are also applicable to the statistical analysis per the Unified Guidance:

- No statistical analyses are required on wells and analytes containing 100% non-detects (EPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects in the background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the practical quantitation limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects the Kaplan-Meier non-detect adjustment is applied to the background data.
- Non-parametric prediction limits are used on data containing greater than 50% non-detects.

5.2.2 Appendix IV Evaluation

When in corrective action, Appendix IV constituents are sampled semi-annually, and concentrations are compared to GWPS. Following the Unified Guidance, spatial variation for Appendix III parameters is tested using the ANOVA; this test is not prescribed for Appendix IV constituents. Unlike the statistical evaluation of Appendix III constituents (where single-sample results are compared to the statistical limit), Appendix IV analysis uses the pooled results from each downgradient well to develop a well-specific Confidence Interval that is compared to the statistical limit. The statistical limit is either the interwell tolerance limit (i.e., background) calculated using the pool of all available upgradient well data (see Chapter 7 of the Unified Guidance), or an applicable groundwater protection standard such as the MCL. Appendix IV background data are screened for outliers and extreme trending patterns that would lead to artificially elevated statistical limits.

Parametric tolerance limits (i.e., UTLs) were calculated using pooled upgradient well data for Appendix IV parameters with a target of 95% confidence and 95% coverage. The confidence and coverage levels for nonparametric tolerance limits are dependent on the number of background samples. The UTLs were then used as the GWPS.

As described in 40 CFR §257.95(h)(1)-(3) and the ADEM Variance (see **Section 3.4.3**), the GWPS is:

- (1) The maximum contaminant level (MCL) established under 40 CFR §141.62 and 141.66.
- (2) Where an MCL has not been established:
 - (i) Cobalt 0.006 mg/L.
 - (ii) Lead 0.015 mg/L.
 - (iii) Lithium 0.040 mg/L.
 - (iv) Molybdenum 0.100 mg/L.

- (3) Background levels for constituents where the background level is higher than the MCL or rule-specified GWPS.

In corrective action, when the Lower Confidence Limit (LCL), or the entire interval, exceeds the GWPS as discussed in the USEPA Unified Guidance (2009), the result is recorded as an SSL. GWPS for Appendix IV constituents are updated on a biennial schedule. This schedule was initiated in 2019 with updates occurring after the second semi-annual sampling event of each biennial year. Data from upgradient wells collected between updates may still be used to support ASDs (Alternate Source Demonstrations) if merited.

5.3 STATISTICAL EXCEEDANCES

Analytical data from the monitoring period was statistically analyzed in accordance with the Professional Engineer (PE)-certified Statistical Analysis Plan (October 2017) and updated in the August 2020 data screening evaluation performed by Groundwater Stats Consulting. Appendix III statistical analysis was performed to determine if constituents have returned to background levels. Appendix IV monitoring parameters were evaluated to determine if concentrations statistically exceeded the established groundwater protection standard.

5.3.1 Appendix III Constituents

Based on review of the Appendix III statistical analysis presented in **Appendix D, Statistical Analyses**, Appendix III constituents have not returned to background levels. A summary of Appendix III SSIs are provided in the **Executive Summary Table** previously referenced.

5.3.2 Appendix IV Constituents

Table 5, Summary of Background Levels and Groundwater Protection Standards summarizes the background limit established at each monitoring well and the GWPS. A summary table of the statistical limits accompanies the prediction limits in **Appendix D**. As discussed in **Sections 3.3.1.1** and **5.3**, Site GWPS were updated after the Fall 2021 sampling event. As a result, the GWPS for lithium has increased from 0.04 to 0.0809 mg/L.

The following subsections describe statistical exceedances during the semi-annual monitoring events of 2022.

5.3.2.1 First Semi-Annual Groundwater Monitoring Event

During the first semi-annual monitoring event, statistical analysis of Appendix IV data incorporating limits defined in the 2019 ADEM Variance (section 3.4.3) identified the following SSLs over GWPS at the listed downgradient wells. Using a lithium concentration of 0.0809 mg/L, the following exceedances were noted:

- GS-AP-MW-6D: Arsenic, Lithium.
- GS-AP-MW-7: Arsenic, Lithium, Molybdenum.
- GS-AP-MW-15: Lithium.
- GS-AP-MW-21: Lithium.

Although not statistically analyzed due to a limited data set, recently installed downgradient wells GS-AP-MW-13R and GS-AP-MW-46 demonstrated concentrations above the GWPS for arsenic. Statistical analyses will be conducted after a sufficient data set for these wells have been collected. Similarly, recently converted to downgradient wells, GS-AP-MW-15V and GS-AP-MW-21V, exhibited lithium concentrations above the GWPS. Concentrations over the GWPS but not statistically analyzed:

- GS-AP-MW-13R: Arsenic
- GS-AP-MW-46: Arsenic
- GS-AP-MW-15V: Lithium
- GS-AP-MW-21V: Lithium

The combined radium results from GS-AP-MW-16S, GS-AP-MW-17V, GS-AP-MW-25HA, GS-AP-MW-36HA were noted as likely potential outliers in comparison to historical concentrations. Concentrations were significantly higher than previous sampling events. A re-sampling of these wells was conducted between May 10 and 11, 2022 and within 90 days of initial sampling. The results confirm that initial results from the February-March sampling event were outliers as concentrations from the May resample were more similar to historical ranges. This data is summarized below. Re-sample data is included in **Appendix C**.

| Well | Analyte | Units | May 2022 Resample Result | February 2022 Result | Prior Max Concentration |
|---------------|------------------------------|-------|--------------------------|----------------------|-------------------------|
| GS-AP-MW-16S | Combined Radium 226 + 228 | pCi/L | 0.746 | 1.23 | 0.63 |
| GS-AP-MW-17V | Combined Radium 226 + 228 | pCi/L | 0.553 | 7.76 | 0.738 |
| GS-AP-MW-25HA | Combined Radium 226 + 228 | pCi/L | 0.565 | 0.763 | 0.422 |
| GS-AP-MW-36H | Combined Radium 226 + 228 | pCi/L | 1.03 | 7.37 | 4.33 |

5.3.2.2 Delineation Wells

Statistical analyses are not conducted on Site delineation wells. However, a review of analytical data derived from delineation wells identified concentrations above GWPS for the following well, parameter pairs:

- GS-AP-MW-6V: Fluoride, Lithium
- GS-AP-MW-23H: Arsenic
- GS-AP-MW-26H: Lithium
- GS-AP-MW-34HO: Lithium
- GS-AP-MW-41HS: Lithium
- GS-AP-MW-41HD: Lithium

Between the Fall 2021 and Spring 2022 sampling events, arsenic concentrations in GS-AP-MW-15V and lithium concentrations in GS-AP-MW-29H declined to below GWPS.

Table 6, First Semi-Annual Monitoring Event Analytical Results Summary, provides a summary of all detected constituents for the first semi-annual sampling event. Statistical reporting output is included as **Appendix D**.

5.3.2.3 Second Semi-Annual Groundwater Monitoring Event

During the second semi-annual monitoring event, statistical analysis of Appendix IV data incorporating limits defined in the 2019 ADEM Variance (section 3.4.3) identified the following SSLs over GWPS at the listed downgradient wells:

- GS-AP-MW-6D: Arsenic, Lithium.
- GS-AP-MW-7: Arsenic, Lithium, Molybdenum.
- GS-AP-MW-15: Lithium.
- GS-AP-MW-21: Lithium.

Although not statistically analyzed due to a limited data set, recently installed downgradient wells GS-AP-MW-13R and GS-AP-MW-46 demonstrated concentrations above the GWPS for arsenic and GS-AP-MW-5R demonstrated a lithium concentration above the GWPS. Statistical analyses will be conducted after a sufficient data set for these wells have been collected. Similarly, recently converted to downgradient wells, GS-AP-MW-15V and GS-AP-MW-21V, exhibited lithium concentrations above the GWPS.

Concentrations over the GWPS but not statistically analyzed:

- GS-AP-MW-5R: Lithium
- GS-AP-MW-13R: Arsenic
- GS-AP-MW-15V: Lithium
- GS-AP-MW-46: Arsenic
- GS-AP-MW-21V: Lithium

Table 7, Second Semi-Annual Monitoring Event Analytical Results Summary, provides a summary of all detected constituents for the second semi-annual sampling event.

5.3.2.4 Delineation Wells

Statistical analyses are not conducted on Site delineation wells. However, a review of analytical data derived from delineation wells identified concentrations above GWPS for the following well, parameter pairs:

- GS-AP-MW-6V: Fluoride, Lithium
- GS-AP-PZ-16: Lithium
- GS-AP-MW-23H: Arsenic
- GS-AP-MW-25HA: Arsenic
- GS-AP-MW-26H: Lithium
- GS-AP-MW-27HR: Lithium
- GS-AP-MW-29H: Lithium

- GS-AP-MW-34HO: Lithium
- GS-AP-MW-41HS: Lithium
- GS-AP-MW-41HD: Lithium

It is important to note that location GS-AP-MW-16S, sampled for the first time during the second semi-annual monitoring event in 2020, has provided a concentration range for lithium between 0.0574 and 0.140 mg/L in 6 sampling events. This monitoring location, located hydraulically upgradient from the Ash Pond, exhibit elevated lithium concentrations similar to upgradient well GS-AP-MW-17V, and provides a second hydraulically upgradient location with lithium concentrations above the Federally derived GWPS (described in **Section 3.4.3**). The lithium concentration of 0.140 mg/L observed in GS-AP-MW-16S is higher than that of delineation wells GS-AP-MW-26H, and therefore, may further reduce the count of wells over the lithium GWPS after further evaluation and next scheduled update to site GWPS (Fall 2023). This along with the discussion provided in the most recent Semi-Annual Progress and Groundwater Delineation Report (September 2020) provide strong lines of evidence that naturally occurring lithium exists at elevated concentrations.

Fluoride, detected at concentrations above the GWPS in vertical delineation well GS-AP-MW-6V, is not being considered as an impact from the Ash Pond and is not being evaluated for delineation. The following lines of evidence support this point:

- (1) Absence of fluoride in pore-water samples (Ash Pond source water) where fluoride concentrations were non-detect in 2 of 3 samples and detected at a low-level, estimated concentration in the third sample (0.0756 (J) mg/L). This implies that the ash pond is not a source of such high concentrations of fluoride.
- (2) No other compliance or delineation wells sampled contained elevated fluoride concentrations. Fluoride concentrations in other wells ranged from 0.1 to 2.07 mg/L and averaged 0.34 mg/L.
- (3) Fluoride concentrations in paired wells, GS-AP-MW-6S and GS-AP-MW-6D, provided concentrations of 0.164 and 0.108 mg/L, respectively during the first semi-annual monitoring event. Concentrations ranged from 0.1 (J) to 0.164 mg/L during the second semi-annual monitoring event.
- (4) GS-AP-MW-6V is a relatively new and deeper screened well which can introduce geochemical variability due to (1) localized variability or isolated source in the geologic formation and/or (2) a temporary disequilibrium caused by the installation of a new well.

6.0 ALTERNATE SOURCE DEMONSTRATION

An alternate source demonstration (ASD) was submitted in July 2021 and attached to the 2021 Annual Groundwater Monitoring and Corrective Action Report in January 2022. The alternate source demonstration focuses primarily on (1) the contribution elevated pH has on arsenic and lithium concentrations in wells GS-AP-MW-15/15V and GS-AP-MW-21 and (2) a comparison of Gorgas AP pore-water geochemistry to the geochemistry of downgradient wells. This study and previous data obtained documenting elevated trace metals in Warrior Basin (Pottsville) coal measures strata provides sufficient confidence to determine that many historical exceedances at the site are related to elevated pH and/or elevated trace metals in these coal measures.

The following bullets summarize key lines of evidence documented in the ASD and supporting alternative sources:

- Wells analyzed provided a ratio of lithium to boron different than pore-water samples (source).
- Wells analyzed provided a different geochemical fingerprint (geochemical facies) from pore-water samples.
- Substantial differences in the relative abundance of boron in comparison to chloride and lithium (i.e., conservative ions) in GS-AP-MW-15, GS-AP-MW-15V, and GS-AP-MW-21 compared to Ash Pond porewater indicate an alternate source for lithium.
- High sodium concentrations (+200 mg/L) and alkaline pH (> 10) of groundwater at GS-AP-MW-15, GS-AP-MW-15V, and GSAP-MW-21 relative to upgradient water and Ash Pond porewater indicates the potential for sodium-bentonite and grout contamination; sodium-bentonite may allow for cation exchange with lithium.
- Lithium is naturally occurring and environmentally available in the bedrock at Plant Gorgas, as identified by chemical analysis and sequential extraction of rock samples.

As suggested and described in numerous previous reports (*most notably - September 2020 Progress and Groundwater Delineation Report*), detailed analyses of geochemistry data indicate that impacts to groundwater are concentrated north of the ash pond dam. Rock chemistry data as well as published technical reports provide sufficient documentation on sources of trace metals. Historical disturbances created by mining in and around Gorgas can also contribute to an increase in some constituents.

Additionally, during the second semi-annual sampling event of 2021, boron isotopic analyses were conducted on select well locations to further explore natural or alternative source potential. The following

well locations, which exhibited concentrations over GWPS during 2022 sampling events, have boron isotopic signatures indicative of natural or alternative sources of COI.

| Well | Sample Date | $\delta^{11}\text{B}$ (‰) | B (mg/L) |
|-------------|--------------------|---|-----------------|
| MW-23H | 7/27/2021 | 3.2-4.2 | 0.0474 |
| MW-41HS | 7/28/2021 | 3.6-5.0 | 1.09 |
| MW-6V | 8/2/2021 | 13.3 | 0.1010 |
| MW-15V | 8/3/2021 | 29.2-31.1 | 0.0601 |
| PZ-22 | 8/3/2021 | 2.7 | 0.0478 |
| MW-34HO | 7/27/2021 | 13.8-18.5 | 0.106-0.108 |

Historically, Plant Gorgas has used coals from the Appalachian Basin (Warrior Basin included). Data included in Ruhl et al. (2014) indicate that ash derived from Appalachian Basin coals display a $\delta^{11}\text{B}$ range of -2.7 to -17.6 ‰. In terms of natural occurring sources of boron, (A) groundwater typically displays a $\delta^{11}\text{B}$ range between 2 and 18 ‰, (B) precipitation between 7 and 23 ‰, and soil/rocks between 0 and -5 ‰.

Many other wells were not analyzed due to historically low boron concentrations or absence of concentration over the GWPS. A geogenic study investigating natural sources of COI at the Site will be initiated in 2023 to follow up on the previously submitted ASD as well as geochemical evaluations conducted since that have highlighted a likely natural source.

7.0 GROUNDWATER ASSESSMENT AND CORRECTIVE ACTION

As required by Part E of the Order (AO 18-096-GW) and correspondence from ADEM (March 2021), this report provides an update on groundwater delineation activities completed since the submittal of the Facility Plan for Groundwater Investigation (November 13, 2018). The primary purpose of this plan and subsequent phases of work were to identify the horizontal and vertical extent of groundwater impacts defined by EPA Appendix IV groundwater protection standards.

A comprehensive groundwater delineation report summarizing findings was submitted to ADEM in September 2020. The conclusions and results presented indicate that groundwater delineation have been completed to a sufficient degree to define spatial extent of groundwater impacts and to inform a groundwater remedy selection plan.

7.1 CHRONOLOGY OF DELINEATION ACTIVITIES

Beginning in 2019, Semi-Annual Progress Reports have routinely been provided to ADEM in March and September, annually. Alabama Power Company (APC) requested approval to combine information typically provided in the Semi-Annual Progress Reports with Semi-Annual Groundwater Monitoring and Corrective Action Reports on March 15, 2021. ADEM approved this approach and revised timeline for submittals on March 16, 2021. APC will now provide the Department with a discussion of delineation results and activities in each semi-annual groundwater monitoring and corrective action report (July; January) until released in writing.

7.1.1 Delineation Wells

Part B of the Order required the installation of additional wells as necessary to define the extent of groundwater impacts. The following sections describe monitoring wells installed to delineate impacts to groundwater.

Phase I – Groundwater Investigation (January 2019 – August 2019)

Phase I was conducted between the dates of January 2, 2019, and August 15, 2019. **Table 1b** and **Figure 5** present details and locations of delineation wells. The following summarizes all activities that were completed during Phase I of groundwater delineation at the Site:

- Installed nine horizontal delineation wells (GS-AP-MW-23H, GS-AP-MW-24H, GS-AP-MW-25H, GS-AP-MW-26H, GS-AP-MW-27H, GS-AP-MW-28H, GS-AP-MW-29H, GS-AP-MW-

30H, and GS-AP-MW-30HS) and four vertical delineation (GS-AP-MW-7V, GS-AP-MW-12V, GS-AP-MW-17V, and GS-AP-MW-18V) wells between January 2, 2019 and February 26, 2019.

- Developed the delineation wells between January 11, 2019, and March 12, 2019. Horizontal delineation wells MW-25H, MW-27H, MW-30H, and MW-30HS and vertical delineation well MW-7V did not yield sufficient water to be developed or sampled and are utilized as water level only piezometers.
- Sampled the eight successfully developed delineation wells and three pre-existing Ash Pond piezometers between February 20, 2019, and March 19, 2019.
- Submitted a Semi-Annual Progress Report documenting groundwater investigation activities on March 30, 2019.
- Submitted a Groundwater Investigation Report to the Department on May 13, 2019. This report recommended a second phase of groundwater investigation to complete delineation of groundwater impacts as required by Part B of the Order.
- Submitted an Assessment of Corrective Measures to the Department on July 11, 2019, as required by Part C of the Order.
- Submitted a Phase II – Groundwater Delineation Plan to the Department on August 15, 2019. This plan documented planned activities associated with proposed Phase II delineation efforts.

Phase II – Groundwater Investigation (September 2019 – March 2020)

Following a review of data gathered from the Phase I Investigation, additional groundwater investigation was proposed to the Department in a Phase II Delineation Plan submitted August 15, 2019, to further delineate extent of groundwater impacts. Phase II was conducted between the dates of September 24, 2019, and March 27, 2020. **Table 1b** and **Figure 5**, present details, and locations of delineation wells and piezometers. The following summarizes all activities that were completed during Phase II of groundwater delineation at the Site:

- Completed semi-annual assessment sampling event in September 2019.
- Installed fifteen horizontal delineation wells (GS-AP-MW-25HA, GS-AP-MW-30HA, GS-AP-MW-31H, GS-AP-MW-32H, GS-AP-MW-33HO, GS-AP-MW-34HO, GS-AP-MW-35HO, GS-AP-MW-36H, GS-AP-MW-37H, GS-AP-MW-38H, GS-AP-MW-39H, GS-AP-MW-41HS, GS-AP-MW-41HD, GS-AP-MW-42H, and GS-AP-MW-43H), three vertical delineation wells (GS-AP-MW-9V, GS-AP-MW-15V, and GS-AP-MW-21V), and converted three existing deep

piezometers (GS-AP-PZ-16, GS-AP-PZ-18, and GS-AP-PZ-22) to vertical delineation wells between September 24, 2019 and January 31, 2020.

- Submitted a Semi-Annual Progress Report documenting groundwater investigation activities on September 30, 2019.
- Developed the delineation wells between November 5, 2019, and January 30, 2020. Horizontal delineation wells GS-AP-MW-41HS, GS-AP-MW-37H, and GS-AP-MW-39H did not produce sufficient water to be developed or sampled and are utilized as water level only piezometers.
- Sampled the fifteen successfully developed delineation wells and converted piezometers between March 16, 2020, and March 27, 2020.
- On December 30, 2019, provided the Department with a response to comments received from the Department on November 14, 2019.
- Surveyed developed wells in January 2020.
- Submitted a Semi-Annual Progress Report documenting groundwater investigation activities on March 30, 2020.

Phase III – Groundwater Investigation (April 2020 – September 2020)

Following a review of data gathered from the Phase I and II Investigations, additional groundwater investigation was conducted to address data gaps. **Table 1b** and **Figure 5**, present details, and locations of delineation wells. The following summarizes all activities that were completed during Phase III of groundwater delineation at the Site:

- Installed two vertical delineation wells north of the Ash Pond (GS-AP-MW-6V and GS-AP-MW-7VR), one horizontal delineation well west of the Ash Pond (GS-AP-MW-40H), and one off-site delineation well (GS-AP-MW-44H0) to the east of the Ash Pond. Onsite well installation activities took place between April 15, 2020, and May 1, 2020, and off-site installation between August 11, 2020 and August 16, 2020.
- Developed the delineation wells between May 27, 2020, and August 27, 2020. Vertical delineation well GS-AP-MW-7VR did not produce sufficient groundwater for well development.
- Sampled delineation wells in September 2020 along with all other delineation and compliance wells as a part of the second semi-annual assessment monitoring event of 2020. Laboratory data will be included with the 2020 Annual Groundwater Monitoring and Corrective Action Report.

- Conducted a study and re-analysis of low-yielding piezometers (GS-AP-MW-1, GS-AP-MW-3, GS-AP-MW-4, GS-AP-MW-7V, GS-AP-MW-16S, GS-AP-MW-20, GS-AP-MW-27H, GS-AP-MW-30H, GS-AP-MW-30HS, GS-AP-MW-37H, GS-AP-MW-39H, and GS-AP-MW-41HS) to assess potential for sampling and inclusion into monitoring well network. A summary memo/report will be included with the 2020 Annual Groundwater Monitoring and Corrective Action Report.
- Submitted a Semi-Annual Progress and Groundwater Delineation Report documenting groundwater investigation activities on September 30, 2020.
- Responded to the February 3, 2021, ADEM Semi-Annual Progress and Groundwater Delineation Reports comments letter on March 5, 2021.
- Responded to the January 20, 2021, ADEM Groundwater Monitoring Plan comments letter and included a Supplemental Site Hydrogeologic Characterization Report on March 8, 2021.
- Submitted the second revised Groundwater Monitoring Plan to the ADEM on March 15, 2021.

Phase IV – Groundwater Investigation (June 2021 – July 2022)

Phase IV of delineation is focused on (1) addressing potential data gaps in lithium delineation and (2) evaluating alternative sources (naturally occurring and/or mine-related) of elevated lithium in wells where geologic and geochemical data already indicate the strong potential for an alternate source. Phase IV included the following scope:

- Re-attempting delineation wells GS-AP-MW-27H and GS-AP-MW-37H.
- Vertical delineation adjacent to well GS-AP-MW-23H.
- Vertical delineation adjacent to well GS-AP-MW-3 (converted to compliance location) and horizontal delineation east of well GS-AP-MW-3.
- Addressing general data gaps in the American coal flow system.
- Boron isotope sampling and analyses at selected well locations.
- Further geochemical study and evaluation of the occurrence of elevated lithium and arsenic.

During Phase IV numerous (19) replacement, additional compliance, and delineation wells were installed and developed. Each of these will add valuable information relevant to assessment. Replacement wells installed, surveyed, and developed include compliance replacement locations: GS-AP-MW-1R, GS-AP-

MW-5R, GS-AP-MW-9R, GS-AP-MW-10R, GS-AP-MW-11R, GS-AP-MW-13R, GS-AP-MW-14R, GS-AP-MW-18R, and GS-AP-MW-18VR. Additional compliance wells were also installed. These include GS-AP-MW-3V, GS-AP-MW-46, and GS-AP-MW-47. Information related to well construction details and screened lithology can be found in **Table 1a**. Additional or replacement delineation wells were also installed during the Fall. These locations included: GS-AP-MW-23V, GS-AP-MW-27HR, GS-AP-MW-37HR, and GS-AP-MW-PZ-18R. Information related to well construction details and screened lithology can be found in **Table 1b**. These wells were sampled for the first time during the February-March 2022 sampling event...

7.2 NATURE AND QUANTITY OF RELEASE

Part B of the Order also required collecting data on the nature and estimated quantity of material released. To collect data regarding the nature of the source and estimated quantity of material released sampling of ash pore-water at three (3) locations was conducted. Ash pore-water was sampled for all EPA Appendix III and IV constituents. Groundwater quality data is compared to source water and leachate composition to provide a basis for evaluating the degree to which the source area has contributed constituents to groundwater.

7.3 DISCUSSION OF DELINEATION RESULTS

Groundwater Monitoring and Corrective Action reports for the Plant Gorgas Ash Pond have identified SSLs in groundwater for arsenic, lithium, and molybdenum. For the first semi-annual groundwater monitoring event, isoconcentration maps for arsenic, lithium, and molybdenum are presented in **Figures 8A, 8B, 9A, 9B, and 10**, respectively. Isoconcentration maps for the second semi-annual groundwater monitoring event are presented in **Figures 11A, 11B, 12A, 12B, and 13**. As shown on these figures, SSLs have been observed in three distinct flow systems – (1) Pratt Flow System, (2) American Flow System, and (3) Gillespy Flow System (north of dam).

Isoconcentration lines shown on **Figures 8A through Figure 13** are data-driven contours derived from the spatial distribution of constituent concentrations in the well network. When spatially distributed objects are spatially correlated (objects close to together have similar characteristics) interpolation analysis can be used to predict “unknowns” between objects. ArcGIS and Geostatistical Analyst are utilized to interpolate chemical concentrations between well locations. This process involves the transformation of chemical concentration data to log-normal distribution prior to interpolation. In cases where concentrations decrease below the GWPS in between well pairs, the extent of groundwater impacts are interpreted from the

interpolated (predicted) data set. This method considers the spatial pattern of decreasing concentrations observed in nearby wells. Additionally, when applicable, isoconcentration maps have been subdivided by major flow system (Pratt or American).

The location and spacing of delineation wells are based upon the following goals and site factors:

1. Determine if impacts to groundwater could extend off-site in the direction of groundwater flow away from the facility.
2. Evaluate potential for vertical migration adjacent to compliance wells with SSLs and within the context of site hydrogeology.
3. Address key data gaps between phases – working in from property line or off-site depending on gaps.
4. Ability to safely access locations with drill rig and supporting equipment.
5. Occurrence of groundwater and sufficient groundwater yield/recharge at locations.
6. Delineate extent of impacts and capture additional hydrogeologic data necessary to evaluate the feasibility of groundwater remediation technologies.

As shown on **Table 1c**, 29 delineation wells have been installed at the site to assess potential impacts. Additionally, 3 delineation wells were installed but did not produce sufficient groundwater yield to sample (**Table 1b**).

Arsenic Delineation

At the site, arsenic has historically exceeded the GWPS at compliance wells GS-AP-MW-6S, GS-AP-MW-6D, GS-AP-MW-7, and GS-AP-MW-15 and more recently, delineation wells GS-AP-MW-15V, GS-AP-PZ-18, GS-AP-MW-21V, and GS-AP-MW-23H. **Figure 8A** shows the extent of arsenic concentrations over the 0.01 mg/L GWPS observed in the first semi-annual event data. During the February-March 2022 sampling event, arsenic exceedances were limited to the Pratt Flow System and Gillespy Flow System. As shown on **Figure 8B**, arsenic concentrations in the American Flow System were below the GWPS.

Monitoring locations GS-AP-MW-15, GS-AP-MW-15V, and GS-AP-MW-21V have largely exhibited downward trends since the September 2020 sampling events and all exhibited concentrations below the GWPS for arsenic during the February-March 2022 sampling event. These trends generally correlate to decreasing pH or decreasing conductivity.

Compliance monitoring well GS-AP-MW-6S has been below the GWPS for arsenic 4 out of the previous 5 sampling events but was slightly above (0.0106 mg/L) the GWPS during the February-March 2022 sampling event. DO and ORP have been trending upward since the latter half of 2019 and generally correlate with a decreasing arsenic trend in well GS-AP-MW-6S. This trend also overlaps with the ceasing of sluiced ash to the ash pond and on-set of closure activities.

Two recently installed downgradient wells, GS-AP-MW-13R and GS-AP-MW-46, demonstrated arsenic concentrations above the GWPS (**Figure 8A**). These are the first sampling results from these two well locations and therefore, (A) concentrations may reflect temporary disequilibrium caused by the well installation process and (B) have not been delineated due to this being the first round of sampling results. It is recommended that an additional 3-4 sampling events be conducted prior to discussing these specific arsenic concentrations as exceedances attributable to the ash pond and in the context of delineation. Nearby well, GS-AP-MW-12, presents an example of the potential disequilibrium conditions leading to increased arsenic during initial sample events. The data below shows elevated arsenic during the first sampling event followed by a steady decreasing trend. The correlation with conductivity shows that disturbance created by disequilibrium may have been the source of elevated arsenic initially.

| <u>Well</u> | <u>Date</u> | <u>Conductivity (uS/cm)</u> | <u>Arsenic (mg/L)</u> |
|-------------|-------------|---------------------------------|-----------------------|
| GS-AP-MW-12 | 08-03-2016 | 668.3 | 0.11 |
| GS-AP-MW-12 | 09-20-2016 | 644.1 | 0.0746 |
| GS-AP-MW-12 | 10-25-2016 | 512.6 | 0.0728 |
| GS-AP-MW-12 | 12-13-2016 | 478.8 | 0.0538 |
| GS-AP-MW-12 | 02-08-2017 | 522.9 | 0.0427 |
| GS-AP-MW-12 | 03-29-2017 | 500.4 | 0.0404 |
| GS-AP-MW-12 | 04-26-2017 | 466.5 | 0.0372 |
| GS-AP-MW-12 | 06-07-2017 | 458.3 | 0.0307 |
| GS-AP-MW-12 | 02-20-2018 | 409.9 | 0.0282 |
| GS-AP-MW-12 | 05-15-2018 | 386.8 | 0.0253 |
| GS-AP-MW-12 | 10-16-2018 | 375.5 | 0.0203 |
| GS-AP-MW-12 | 04-16-2019 | 357.9 | 0.014 |
| GS-AP-MW-12 | 09-25-2019 | 394.56 | 0.0135 |
| GS-AP-MW-12 | 03-18-2020 | 362.88 | 0.00693 |
| GS-AP-MW-12 | 09-23-2020 | 324.73 | 0.00616 |
| GS-AP-MW-12 | 02-01-2021 | 355.4 | 0.00747 |
| GS-AP-MW-12 | 08-09-2021 | 345.79 | 0.00308 |
| GS-AP-MW-12 | 02-28-2022 | 342.75 | 0.0066 |
| GS-AP-MW-12 | 07-19-2022 | 313.53 | 0.00407 |

Figures 11A and **11B** show the extent of arsenic concentrations over the GWPS during the second semi-annual monitoring event. Key changes observed from the first semi-annual monitoring event include: (1) slight increase to arsenic in wells GS-AP-MW-15 and GS-AP-MW-25HA (above GWPS) and (2) slight decrease in arsenic in well GS-AP-MW-6S (below GWPS). However, arsenic concentrations in compliance wells GS-AP-MW-6S and GS-AP-MW-15 were not determined to be at SSLs.

As described in **Section 6.0**, an alternate source demonstration was made for historic SSLs in well GS-AP-MW-15. This ASD illustrated that elevated pH and potential grout contamination as the primary drivers for elevated concentrations. Recent data continues to support this mechanism as increases to arsenic are accompanied by similar increases in pH, sodium, potassium, and total alkalinity. It is observed that arsenic concentrations over the GWPS are dominated by pH values above 11 SU and classic grout parameters exhibit strong positive correlations with arsenic (sodium – $R = 0.86/R^2 = 0.74$; potassium – $R = 0.96/R^2 = 0.93$; alkalinity – $R = 0.7/R^2 = 0.49$).

Data from well GS-AP-MW-25HA will continue to be evaluated. Increasing arsenic within this well is strongly correlated with ORP ($R = -0.83/R^2 = 0.69$), iron ($R = 0.97/R^2 = 0.93$), sulfate ($R = -0.85/R^2 = 0.72$), and pH ever so slightly decreasing down to around 8.5 SU (from 8.7 SU). The strong negative correlation of arsenic with ORP and sulfate and the strong positive correlation with iron suggests that iron-reducing predominate sulfate-reducing condition, and the occurrence of arsenic may be related to the dissolution of iron from hydroxides.

Spatially, arsenic exceedances appear concentrated to the north of the ash pond dam where strong hydraulic gradients create a small area of preferential groundwater flow (**Figure 11A**). In this area, recent concentrations over the GWPS were observed in wells GS-AP-MW-6D, GS-AP-MW-7, and GS-AP-MW-23H. Compliance wells GS-AP-MW-6D and GS-AP-MW-7 are screened across or proximal to the Gillespy coal or equivalent horizon (when absent) and arsenic is horizontally delineated in the same horizon by delineation wells GS-AP-MW-41HS and GS-AP-MW-41HD.

Vertically, arsenic is delineated by GS-AP-MW-6S, GS-AP-MW-6V, GS-AP-MW-23V and the absence of groundwater flow beneath the GS-AP-MW-7 screened interval (no yield zones encountered in delineation wells attempted at GS-AP-MW-7V and GS-AP-MW-7VR). Arsenic in well GS-AP-MW-6S has been below the GWPS during 5 of the last 6 sampling events and correlates to a general increasing trend in DO. Unless a significant trend reversal occurs, this location is suitable for the uppermost vertical delineation of arsenic. The stratigraphy in this area is detailed in **Figure 4F**.

Additional study is required to determine the source of arsenic in horizontal delineation well GS-AP-MW-23H. The following lines of evidence suggest the possibility of a source other than the ash pond:

- (1) Screened interval is located above the base of CCR material and approximately 50 feet higher than Gillespy or equivalent monitored by GS-AP-MW-6D, GS-AP-MW-7, and GS-AP-MW-41HS/HD.
- (2) Physical location of well appears separated from preferential flow (upslope of valley) and groundwater elevations appearing separate from other wells upgradient of GS-AP-MW-23H.
- (3) Low boron concentrations and poor correlation coefficient with boron concentrations
- (4) Low lithium concentrations
- (5) $\delta^{11}\text{B}$ value of 3.2 to 4.2 ‰ which indicates strongest potential for a natural or meteoric source of boron.
- (6) Iron concentrations between 46 and 50 mg/L – which are 5 times higher than the next highest well (GS-AP-MW-26H) and much greater than the site average which otherwise ranges from 0.85 to 1.82 mg/L from 2019 to 2022.
- (7) Low pH range – which is typically observed between 5.8 and 6.3 and much lower than the site average which varies between 7.83 and 8.09 SU from 2019 to 2022.

A secondary cluster of arsenic exceeding the GWPS is located proximal to the central portions of the ash pond within the Pratt Flow System (**Figure 11A**). Here locations GS-AP-MW-13R, GS-AP-MW-46, and GS-AP-MW-15 demonstrated concentrations above the GWPS during the July-August sampling event.

GS-AP-MW-13R and GS-AP-MW-46 have been sampled only twice and therefore, (A) concentrations may reflect temporary disequilibrium caused by the well installation process and (B) have not been delineated due to this being the first round of sampling results. It is recommended that an additional 2-3 sampling events be conducted prior to discussing these specific arsenic concentrations as exceedances attributable to the ash pond and in the context of delineation.

Nearby well, GS-AP-MW-12, presents an example of the potential disequilibrium conditions leading to increased arsenic during initial sample events. The data below shows elevated arsenic during the first sampling event followed by a steady decreasing trend. The correlation with conductivity shows potential “new well” trauma associated disequilibrium.

In summary, arsenic exceedances to the north have been successfully delineated within the Gillespy Flow system. Analytical data from future sampling events will be reviewed to determine need for additional delineation and/or an alternate source demonstration study to address arsenic at locations GS-AP-MW-13R and GS-AP-MW-46. Arsenic concentration in well GS-AP-MW-25HA will be evaluated similarly over the next 2-3 sampling events.

Lithium Delineation

Lithium exceedances were observed in the American Flow System, Pratt Flow System, and Gillespy Flow System during each of the semi-annual monitoring events of 2022.

Gillespy Flow System

Figure 9A shows the spatial extent of potential lithium impacts within the Pratt and Gillespy flow systems (**Figure 9A Inset Map shows Gillespy/Pratt Transition - north of dam only**) during the first semi-annual groundwater monitoring event. North of the dam and in the Gillespy Flow System, lithium concentrations over the GWPS are noted in wells GS-AP-MW-6D, GS-AP-MW-6V, GS-AP-MW-7, GS-AP-MW-41HS, and GS-AP-MW-41HD.

Figure 12A shows the spatial extent of potential lithium impacts within the Pratt and Gillespy flow systems (**Figure 12A Inset Map shows Gillespy/Pratt Transition - north of dam only**) during the second semi-annual groundwater monitoring event. **Figure 12A** shows little appreciable change in lithium concentration relative to the first semi-annual groundwater monitoring event (**Figure 9A**). North of the dam and in the Gillespy Flow System, lithium concentrations over the GWPS are noted in wells GS-AP-MW-6D, GS-AP-MW-6V, GS-AP-MW-7, GS-AP-MW-41HS, and GS-AP-MW-41HD.

Concentrations in wells demonstrating concentrations over the GWPS generally appear stable over time. North of the dam, lithium concentrations are delineated to below GWPS concentrations in the direction of groundwater flow by wells GS-AP-MW-23H, GS-AP-MW-23V, GS-AP-MW-24H, and GS-AP-MW-42H.

As previously described in the *September 2020 Progress and Groundwater Delineation Report*, no deeper flow zones were observed beneath the screened intervals of GS-AP-MW-7, GS-AP-MW-41HD, and GS-AP-MW-6V. Boring, geophysical, hydrophysical, and “dry” piezometer data indicate that flow to the north is accommodated by 2-3 discrete fracture/bedding planes in the Gillespy Coal Group and Pratt-Gillespy Coal transition zone. This data suggests little to no groundwater yield beneath these discrete planes. Lower than GWPS concentrations in groundwater yielding zones above these discrete zones also correlate with preferential flow conditions.

Additional delineation locations are not feasible or severely limited due to topography, saturated conditions, ash pond closure activities, and utilities. However, sufficient delineation and site hydrogeologic data has been studied to understand suitable remedial technologies in these areas. For instance, a permeation grouting pilot program, is being evaluated for application across these 2-3 discrete flow zones.

As shown on **Figure 9A and Figure 12A**, the highest concentrations of lithium correlate to areas previously mined (dashed lines showing Pratt Strip Mines). This observation indicates that historical mining could contribute, to some extent, to the elevated lithium concentrations north of the dam.

As boron and lithium behave similarly in groundwater (largely unreactive), boron isotopic results can provide an indication of the source of lithium. Boron isotopes have been studied and implemented as tracer for CCR impacts to groundwater (Davidson and Bassett, 1993; Ruhl et al., 2014). These studies have shown that coal or CCR sources are definitively identified by a distinctive negative $\delta^{11}\text{B}$ signature whereas other geologic and anthropogenic sources display positive ratios. Historically, Plant Gorgas has used coals from the Appalachian Basin (Warrior Basin included). Data included in Ruhl et al. (2014) indicate that ash derived from Appalachian Basin coals display a $\delta^{11}\text{B}$ range of -2.7 to -17.6 ‰. In terms of natural occurring sources of boron, (A) groundwater typically displays a $\delta^{11}\text{B}$ range between 2 and 18 ‰, (B) precipitation between 7 and 23 ‰, and soil/rocks between 0 and -5 ‰.

In wells GS-AP-MW-6S and GS-AP-MW-7, boron isotopic results indicate lithium concentrations are sourced from coal or CCR. Conversely, corroborating potential mine or natural sources of lithium are boron isotope data from wells GS-AP-MW-6V and GS-AP-MW-41HS - which show $\delta^{11}\text{B}$ values of 13.3 ‰ and 3.6-5.0 ‰, respectively. These values strongly indicate a source other than the ash pond. Boron isotope data is summarized below.

| <u>Well</u> | <u>$\delta^{11}\text{B}$ (‰)</u> | <u>Boron Source</u> |
|---------------|---|---------------------|
| GS-AP-MW-6S | -6.2 | Coal or CCR |
| GS-AP-MW-6D | -1.7 | Mudstone/Shale |
| GS-AP-MW-6V | 13.3 | Meteoric |
| GS-AP-MW-7 | -12.8 | Coal or CCR |
| GS-AP-MW-23H | 4.2 | Meteoric |
| GS-AP-MW-41HS | 3.6-5.0 | Meteoric |

To summarize these results, boron isotopic analyses strongly suggest that pond derived impacts are restricted to wells GS-AP-MW-6S, GS-AP-MW-7, and potentially, to well GS-AP-MW-6D. Additional

study on the potential geogenic origins of lithium in this area are strongly recommended to clarify the extent of lithium impacts.

Pratt Flow System

Figure 9A also illustrates lithium exceedances observed in the Pratt Flow System where wells GS-AP-MW-15 and GS-AP-MW-21 had concentrations above the GWPS during the February-March 2022 sampling event. The ASD described in **Section 6.0** addresses exceedances in wells GS-AP-MW-15 and GS-AP-MW-21 as unrelated to the ash pond. In addition to the details provided in **Section 6.0**, and the ASD submitted in July 2021, boron isotope analyses were attempted at these two well locations – however, results were below the quantifiable limit.

Figure 12A illustrates lithium concentrations observed during the second semi-annual groundwater monitoring event. During this event, wells GS-AP-MW-15, GS-AP-MW-21, GS-AP-MW-27HR, and GS-AP-MW-29H demonstrated lithium concentrations above the GWPS.

In the areas with potential lithium impacts, horizontal delineation to below GWPS concentration can largely be derived from nearby wells: GS-AP-MW-46, GS-AP-MW-31H, GS-AP-MW-18VR, GS-AP-MW-33HO, GS-AP-MW-17, GS-AP-MW-28H, and GS-AP-MW-36H. Southeast of GS-AP-MW-21, dry wells GS-AP-MW-30H and GS-AP-MW-20 provide data that shows an absence of groundwater yield in Pratt intervals. However, the deeper American Flow System was productive and can be used in the assessment of lithium concentrations.

In terms of vertical delineation, during first semi-annual monitoring event lithium was below the GWPS in well GS-AP-MW-15V (installed in deeper American Flow System), and slightly above the GWPS in well GS-AP-MW-21V, also installed in the deeper American Flow System (**Table 6, Figure 9B**). Conversely, during the second semi-annual groundwater monitoring event, lithium slightly exceeded the GWPS in well GS-AP-MW-15V, and decreased to below the GWPS, in well GS-AP-MW-21V. Both GS-AP-MW-15V and GS-AP-MW-21V have exhibited a general decreasing trend and significantly reduced concentrations from initial sampling events. Like GS-AP-MW-15 and GS-AP-MW-21, lithium concentrations in well GS-AP-MW-15V are influenced strongly by elevated pH.

American Flow System

Figure 9B shows the spatial extent of potential lithium impacts within the American coal flow system during the first semi-annual groundwater monitoring event. Concentrations observed over the GWPS are noted for wells GS-AP-MW-26H, GS-AP-MW-21V, and GS-AP-MW-34HO.

Figure 12B shows the spatial extent of potential lithium impacts within the American coal flow system during the second semi-annual groundwater monitoring event. Concentrations observed over the GWPS are noted for wells GS-AP-MW-5R, GS-AP-MW-15V, GS-AP-PZ-16, GS-AP-MW-26H, and GS-AP-MW-34HO.

Western Areas

The lithium exceedance at GS-AP-MW-26H appears to be (1) elevated naturally occurring lithium or (2) elevated lithium due to an alternate source. Evidence supporting this:

- 1) Absence of lithium exceedances at waste boundary compliance wells upgradient of GS-AP-MW-29H (in both Pratt and American coal screened wells)
- 2) Increasing lithium concentration trend with distance away from the ash pond
- 3) Lack of other CCR indicator parameters:
 - a. Boron – 87.5% non-detect, highest concentration is a low-level, estimated (j-flagged) concentration (0.0334 mg/L (J))
 - b. Molybdenum – 87.5% non-detect or low-level, estimated concentrations
 - c. Arsenic – 87.5% non-detect or low-level, estimated concentrations
- 4) Well location adjacent to Jacobs Mine permit boundary
- 5) Concentration below highest concentration of proposed upgradient well GS-AP-MW-16S indicating lithium in normal concentration range for site.

For these reasons, no further delineation activities are planned near GS-AP-MW-26H for purposes of further delineating lithium. Furthermore, horizontal delineation would technically be achieved in this area by the below GWPS concentrations observed in GS-AP-MW-40H to the west and GS-AP-MW-38H to the south.

Southern Areas/Maxine Mine

Figure 9B shows, to the south, lithium exceedances are noted in American coal or Maxine mine screened locations GS-AP-MW-21V and GS-AP-MW-34HO during the first semi-annual groundwater monitoring event. **Figure 12B** shows that during the second semi-annual groundwater monitoring event GS-AP-MW-15V, GS-AP-PZ-16, and GS-AP-MW-34HO exhibit lithium concentrations above the GWPS.

As presented on these figures, the southern area of the site (south of line from GS-AP-MW-15V to GS-AP-MW-21V) was previously disturbed by the underground Maxine American Seam Mine. The presence of

this mine and its' large spatial extent makes it difficult to install wells that provide truly representative groundwater quality of the American coal flow system.

As previously described, lithium concentrations in well GS-AP-MW-15V are strongly influenced by elevated pH conditions which have ranged between 8.21 and 10.89 standard units (SU). Historical data shows that lithium occurs at higher concentrations with elevated groundwater pH ($R = 0.87$, $R^2 = 0.76$). This data also shows that pH conditions have been steadily decreasing since the initial sampling event in March 2020. Lithium concentrations have similarly decreased, and most notably, since the initial 3 sampling events. This data evaluation suggests that the groundwater geochemistry was likely impacted by the well installation and construction process. Since installation and the initial sampling event, geochemical data suggests that geochemical equilibrium is slowly being restored to more normal conditions. Furthermore, low-level and stable concentrations of boron, suggest a source other than CCR leachate. These data are inserted below for reference.

| <u>Well</u> | <u>Date</u> | <u>pH</u> (SU) | <u>Conductivity</u> (uS/cm) | <u>Chloride</u> (mg/L) | <u>Lithium</u> (mg/L) | <u>Boron</u> (mg/L) |
|--------------|-------------|-------------------|--------------------------------|---------------------------|--------------------------|------------------------|
| GS-AP-MW-15V | 03-18-2020 | 10.89 | 1735.33 | 108 | 0.208 | 0.0565(J) |
| GS-AP-MW-15V | 09-21-2020 | 10.07 | 1858.9 | 171 | 0.116 | 0.0712(J) |
| GS-AP-MW-15V | 02-09-2021 | 9.55 | 1811.73 | 197 | 0.122 | 0.0722(J) |
| GS-AP-MW-15V | 08-03-2021 | 8.97 | 1532.78 | 176 | 0.0986 | 0.0601(J) |
| GS-AP-MW-15V | 02-16-2022 | 8.65 | 1398.52 | 129 | 0.0788 | 0.0579(J) |
| GS-AP-MW-15V | 08-02-2022 | 8.21 | 1392.92 | 126 | 0.096 | 0.0589(J) |

For well GS-AP-MW-15V, the 2022 analytical data sets begin to show concentrations and values similar to historical averages for the American flow system beneath the Site. When pH conditions are confirmed to have stabilized, it will be most appropriate to evaluate lithium concentrations as representative and for potential groundwater impacts. At a minimum, data collected prior to 2022 appears unrepresentative of Site groundwater quality.

To the southwest, well locations GS-AP-MW-36V, GS-AP-PZ-16, and GS-AP-PZ-22 can be used to effectively demonstrate horizontal delineation in the American coal and Maxine Mine. Maxine mine

location, GS-AP-PZ-16, was below the lithium GWPS during the first semi-annual sampling event and slightly above the GWPS during the second semi-annual sampling event with an average annual concentration below GWPS (0.074 mg/L).

However, due south, horizontal delineation well GS-AP-MW-34HO does exceed the GWPS for lithium but also quite notably, appears to present a case as a potential outlier. As shown on **Figures 9B** and **12B**, the lithium concentration observed is two or more times higher than observed in wells more proximal to the waste boundary.

Regarding elevated lithium concentrations in delineation well GS-AP-MW-34HO, there are lines of evidence supporting an alternate source:

- 1) Increasing lithium concentration trend with distance away from the ash pond
- 2) Low concentrations of other CCR indicator parameters:
 - a. Boron – 0.0827 (J) to 0.109 [mg/L]
 - b. Molybdenum – 0.00386 (J) to 0.0143 (J) [mg/L]
 - c. Arsenic – 0.00308 (J) to 0.00668 [mg/L]
- 3) Chloride concentrations significantly greater than CCR pore-water
- 4) Geochemical facies representative of ancient groundwater (sodium-chloride) and different than CCR pore-water (calcium-chloride)
- 5) Boron isotopic fractionation not representative of CCR signature – where a $\delta^{11}\text{B}$ value of 13.8 to 15.7 ‰ suggests a meteoric signature of boron, and thus, lithium.
- 6) Well location surrounded by the large-scale, underground Maxine Mine.

For these reasons, no further delineation activities are planned near GS-AP-MW-34HO for purposes of further delineating lithium.

Well location GS-AP-MW-21V has demonstrated concentrations below the GWPS two of the last three sampling events and only slightly exceeded the GWPS during the first semi-annual sampling event of 2022. Overall, lithium concentrations in well GS-AP-MW-21V have decreased notably from the results of the first three sampling events. Lithium concentration patterns are paralleled by those of groundwater conductivity which were significantly elevated during the first three sampling events. Similar to the discussion of GS-AP-MW-15V, groundwater geochemistry in well GS-AP-MW-21 may have been disturbed by the physical process of well installation and construction. Trends suggest that geochemical equilibrium was restored or close to restored beginning with the second semi-annual monitoring event of

2021. No additional delineation is planned in the vicinity of GS-AP-MW-21V. Additional activities may be planned, pending a review of the July 2021 ASD.

Northern Areas

As shown on **Figures 9B** and **12B**, lithium concentrations were well below the GWPS during the first semi-annual groundwater monitoring event and slightly above during the second semi-annual groundwater monitoring event. These two data points represent the first two sampling events obtained from well GS-AP-MW-5R which was recently installed as a replacement well. Additional sampling events and data are needed to evaluate lithium concentrations as representative of Site groundwater quality. Based upon the discussion and findings of initial geochemical disequilibrium observed in wells GS-AP-MW-12, GS-AP-MW-15V, and GS-AP-MW-21V, this evaluation will likely require 6 to 8 sampling events prior to establish a sufficient understanding of geochemical behavior and trends. Recommendations will be made upon completion of this evaluation.

Molybdenum Delineation

Figures 10 and **13** shows the extent of potential molybdenum impacts to groundwater observed during 2022 sampling events. Molybdenum exceeded at compliance location GS-AP-MW-7 (Gillespy Group) located north of the ash pond dam. Horizontally, molybdenum has been delineated on-site by delineation wells GS-AP-MW-23H, GS-AP-MW-24H, GS-AP-MW-41HD, and GS-AP-MW-42H. Two vertical delineation wells have been attempted in the vicinity of well GS-AP-MW-7. GS-AP-MW-7V was installed approximately 200 feet below ground surface (BGS) in a sandstone unit and GS-AP-MW-7VR was installed across a thin coal seam encountered at a depth of 145 feet BGS. Locations GS-AP-MW-7V and GS-AP-MW-7VR did not yield sufficient groundwater recharge for well development or low-flow groundwater sampling methods.

Furthermore, borehole geophysical logs reviewed from GS-AP-MW-7, MW-7V, and MW-7VR (chiefly fluid resistivity and fluid temperature logs) did not provide robust evidence of groundwater flow zones deeper than 88 feet BGS where GS-AP-MW-7 already monitors. The fracture encountered at GS-AP-MW-7 and noted in geophysical logs acquired in MW-7V and MW-7VR appears to be the basal and most prominent flow feature in the area. No additional vertical delineation is proposed in the vicinity of GS-AP-MW-7.

7.4 STATUS OF DELINEATION

As described in **Section 7.1.1**, a 4th phase of work and study has recently been conducted. The 19 recently installed well locations were generally designed to address these potential data gaps. All newly installed and existing wells were sampled for the first time during the spring of 2022. A review of recent data identified the potential data gaps, listed below. However, since gaps are primarily associated with newly installed wells, or wells where significant signatures of natural/alternate sources are present in the data, the recommended plan of action is to:

- (1) Evaluate the occurrence, distribution, and mobility of naturally occurring lithium in subsurface geologic materials (generally using recent Gorgas Gypsum Pond study as template).
- (2) Allow for the collection of 4 to 6 additional groundwater samples in recently installed wells prior to evaluation.
- (3) Upon review of the above tasks and result, evaluate the need for potential additional delineation and assessment. Following 2022 sampling results, potential needs are outlined below.

Lithium Delineation

- Pratt Flow System
 - ***Horizontal delineation (or new compliance well), re-attempt: east and/or southeast of GS-AP-MW-21***
- American Flow System
 - *Horizontal delineation or new compliance well to the southeast (between GS-MW-30HA and GS-AP-MW-34HO).*

Arsenic Delineation

- Pratt Flow System
 - ***Potential Future Action: (A) Horizontal delineation west-southwest of GS-AP-MW-11R and off-set vertical delineation, (B) Horizontal delineation east of GS-AP-MW-46 and off-set vertical delineation. These are labeled potential future actions pending the recommendation to re-evaluate data and trends after 6-8 sampling events. Rationale for this recommendation is provided in the Arsenic Delineation portion of Section 7.1.3.***

The bolded text in the bulleted list above indicates that an ASD has been presented to address these exceedances and selected data gaps. A review of the data revealed no data gaps associated with molybdenum impacts.

7.5 GROUNDWATER REMEDY AND CORRECTIVE ACTION

An Assessment of Corrective Measures (ACM) for groundwater impacts was conducted and formally submitted to ADEM in June 2019. Additional data analyses and investigations conducted since the ACM culminated with a more detailed Groundwater Remedy Selection Report, submitted in December 2021, and a Corrective Action Groundwater Monitoring Program document submitted in March 2022.

| Submittal | Submittal Date | Purpose |
|--|----------------|--|
| Assessment of Corrective Measures | 06/2019 | Initial evaluation of the feasibility, performance, and implementation of known and emerging groundwater remediation technologies against site conditions and factors. |
| Groundwater Remedy Selection Report | 12/2021 | Formal selection and detailed description of groundwater remedies selected for implementation at the site. |
| Corrective Action Groundwater Monitoring Program | 03/2022 | Plan document to describe process and program for implementation and monitoring of groundwater remedies selected at the site. |

7.5.1 Groundwater Remedy Selection

As described in **Section 5** and **Section 7.3**, geochemical data gathered and analyzed indicates that groundwater impacts may be constrained to a small area north of the dam and between wells GS-AP-MW-6S, GS-AP-MW-7, and GS-AP-MW-41HD. A small footprint of impacted groundwater flowing through well defined, discrete bedding provides an opportunity for a very targeted groundwater remediation program. The Groundwater Remedy Selection Report described the selected remedies for groundwater corrective actions at the site:

- Source control to include dewatering, consolidation, and capping of the CCR unit,
- Permeation grouting in areas of higher concentrations of constituents of interest (COI) and/or preferential groundwater flow pathways to prevent COI movement,
- Monitored natural attenuation (MNA) over the entire site.

Geochemical manipulation is also being researched for feasibility in application and delivery to these well constrained, discrete flow intervals. A scope of work is also being established to guide potential compatibility testing.

Closure of the CCR Unit – including dewatering, consolidation, and capping – will greatly reduce or eliminate source contributions to groundwater. Permeation grouting was selected because, as a corollary to barrier walls, it impedes groundwater flow and helps prevent the migration of COIs away from the source area. Additionally, permeation grouting can also be viewed as a complementary method to MNA – where either the sealing of groundwater flow or the slowing of the flow path away from the source area provides longer residence time for MNA processes or geochemically enhanced MNA processes to reduce COI concentrations. MNA was selected based upon the evidence gathered during initial investigations - which highlighted that these processes are already occurring.

7.5.2 Corrective Action – Groundwater Monitoring Program

The Corrective Action Groundwater Monitoring Program describes early plans for implementation and monitoring of groundwater remedies described above. This plan chunked the program into two stages.

- Stage 1 will include ongoing compliance monitoring, remedial effectiveness monitoring for permeation grouting, MNA performance monitoring, sentinel/clean-line monitoring (including surface water monitoring), and demonstration that Site conditions remain protective of potential human and ecological receptors. Prompt action will be taken should data or data trends indicate such actions are warranted.
- Stage 2 monitoring will be implemented upon Site closure, with the first 2 years of Stage 2 monitoring consisting of background data collection to serve as a baseline. Stage 2 monitoring will be composed of ongoing compliance monitoring, additional wells or sampling locations as needed to evaluate remedy effectiveness, additional MNA parameters as needed, mass and mass flux calculations, additional monitoring associated with permeation grouting (if implemented), re-evaluation of natural attenuation processes and efficacy every 10 years, and demonstration that Site conditions remain protective of potential human and ecological receptors.

Stage 1

The initial phase of Stage 1 has implementation tasks associated with each selected groundwater remedy that serve as a foundation for the remainder of Stage 1 and Stage 2:

| Selected Remedy | Implementation Task(s) |
|-----------------------------------|--|
| Monitored Natural Attenuation | 1. Implementation of expanded MNA sampling parameters. 2. Further assessment of MNA monitoring network. |
| Permeation Grouting Program | 1. Plan, Work Scope development and field program for the detailed characterization of fracture flow characteristics and data needs supporting a permeation grouting pilot 2. Implementation of Permeation Grouting Pilot Program using data collected from detailed characterization. |
| Source Control/Closure Activities | 1. Evaluation of geochemical changes in groundwater with respect to transient closure activities (excavation, de-watering, etc). 2. Implementation of field data collection instruments/telemetry within key monitoring wells to further understand the nature of geochemical changes over time and with respect to closure activities and MNA/geochemical modelling. |

Implementation of Monitored Natural Attenuation

MNA sampling parameters were added to the sampling plans and analyzed in the laboratory during the February-March 2022 sampling event (**Table 6**) and continued during the July-August 2022 sampling event (**Table 7**). These parameters in addition to field parameters, Appendix III, and Appendix IV parameters are utilized to study the processes that govern or facilitate MNA as well as changes in geochemical conditions. Parameters will be included in the site geochemical model.

Permeation Grouting Program

An Implementation and Data Requirements Plan – Permeation Grouting Pilot Program is being drafted to outline means and methods for the complete geologic and hydrogeologic characterization of the area of the site selected for the pilot study. This document provides a plan for the detailed characterization of fracture flow through the Pottsville Formation – including standards for core logging, downhole geophysical methods, hydrogeophysical methods, and aquifer performance testing. This plan will be executed in the field and data analyzed to complete the initial study or foundation phase of the Permeation Grouting Pilot Program.

The tentative schedule for this initial foundation phase is outlined as:

- Implementation and Data Requirements Plan – Permeation Grouting Pilot Program (1st quarter 2023).
- Fracture-Flow Field Study and Data Analyses – 4th quarter 2022 to 2nd quarter 2023
- Permeation Grouting Pilot Program – TBD, pending requisite documents and approvals supporting the injection program.

Source Control/Closure Activities

The primary task and objectives at the on-set of Stage 1 include: (1) monitoring and reviewing for changes in geochemical conditions that would invoke an adaptive trigger, (2) studying transient changes in groundwater quality that may be the result of physical closure activities, and (3) determination of primary mechanisms and geochemical relationships at play in changing geochemical conditions. The understanding of mechanisms and relationships leading to geochemical changes in groundwater provides opportunity to further understand natural MNA processes at the site and document benefits/impacts of source control as closure progresses.

As a part of the Semi-Annual Monitoring Reporting process, groundwater quality is being evaluated with respect to:

- 1) Concentration Trends
 - a) By Analyte
 - b) By Locations
 - c) In Aggregate
- 2) Geochemical Correlations
- 3) Concentration Trends/Geochemical Correlations cross-referenced to by recent or active ash pond closure activities.

To facilitate further understanding of trends and correlating relationships, AquaTROLL instrumentation is being installed at select key monitoring well locations for the near continuous monitoring of field parameters. This additional data will allow for a better understanding of the degree of changes driven by different types of closure activities, the response of site flow systems, and possible correlations/changes noted in semi-annual monitoring data.

AquaTROLL instrumentation will be installed during the first half of 2023 (pending supply chain issues) at the following monitoring locations:

- GS-AP-MW-6
- GS-AP-MW-6D
- GS-AP-MW-6V
- GS-AP-MW-7
- GS-AP-MW-18VR
- GS-AP-MW-23H
- GS-AP-MW-23V
- GS-AP-PZ-16

7.5.3 Update on Monitoring Period Activities

Activities focused on corrective action were performed in 2022. The core activities included:

- 1) Desktop study for injectability of bedrock and injection treatability studies
- 2) Sampling of MNA parameters
- 3) Initiation of geogenic evaluation

The objectives of the hydraulic desktop study for injectability of bedrock are twofold, as follows:

- Identify a location near the Plant Gorgas Ash Pond most appropriate for conducting an injection pilot test.
- Provide information that will support scoping a pre-pilot test exploratory field program and, ultimately, the design and implementation of the pilot test.

Treatability studies are also being performed to evaluate reagent composition, dosing, effectiveness, and sequencing (if applicable) for in situ groundwater treatment of COIs via injection. The following activities have been completed:

- Selection of potential locations where a field pilot test may be appropriate based on stratigraphy, COIs at statistically significant levels in groundwater, available bedrock characterization data, and physical accessibility
- Preliminary modeling of the hydraulics of potential reagent injections that may be performed to treat COIs in fractured bedrock–
 - The input parameters for this modeling include hydraulic gradients and groundwater flow directions, depths to groundwater, hydraulic conductivities, mean fracture porosities, and potential treatment zone depths. The results of this preliminary modeling include estimates of injection rates, durations, and volume and areal extent of treatment solution delivery.

Work, either ongoing or scheduled, includes the following:

- Treatability testing to identify suitable reagents that can be used to treat COIs in situ–This work will include an estimate of the mass of precipitated minerals that may form on the fracture surfaces

as a result of the injected treatment solution and its impact on the aquifer transmissivities and hydraulic conductivities.

- Bedrock core sample laboratory analysis of geochemistry (cation exchange capacity; aluminum-, manganese-, and iron-oxide extractions; bulk chemistry; mineralogy; and microanalysis for COIs in fracture fill) and physical parameters (matrix hydraulic conductivity, porosity, and bulk density)
 - The geochemistry results will inform the treatability studies described in the previous bullet. The physical parameters will be used in the predictive modeling as detailed in the following bullets. Both the geochemical and physical analyses will inform the design and implementation of the field pilot tests.

The results of this desktop study for injectability of bedrock and treatability studies will support the following activities:

- Identify data gaps and develop a scope of exploratory field activities that may be conducted to fill those data gaps.
- Perform additional predictive modeling of pilot test injections to help ensure appropriate injection concentration and volume, and monitoring duration and frequency.
- Design and implement the pilot test.

7.6 GROUNDWATER QUALITY CHANGES AND TRENDS

Relatively few groundwater quality trends and changes have been noted to date at the Site. As described in **Section 4.1**, numerous groundwater elevation decreases were noted during the July-August 2022 sampling event. The location, screened interval, and magnitude of groundwater elevation change suggests that mining operations across the American coal seam to the south are a potential driver of these observed changes.

However, smaller magnitude changes in Pratt coal wells in more central areas of the Site may be related to recent initiation of ash pond dewatering operations. These potential locations include wells GS-AP-MW-2, GS-AP-MW-3, and GS-AP-MW-12.

The lack of obvious or significant trends is likely in part due to (1) dewatering operations not starting until the first week of July 2022, (2) the low permeability nature of the subsurface flow systems, and (3) the number of wells that have been recently installed or replaced (too few data points for trend analyses).

Downward Trends

By Volume per Well

A review of downward trend volume shows that wells GS-AP-MW-3 (11), GS-AP-MW-2 (10), GS-AP-MW-9V (10), and GS-AP-MW-7 (9) show the highest counts of non-statistical downward trends (3 consecutive decreases). Spatially, these wells are clustered north-central relative to the ash pond. Downward trends appear to be most commonly occurring across the following constituents at these locations: manganese, barium, boron, calcium, magnesium, lithium, and turbidity.

Decreasing arsenic trends tend to be negatively correlated with DO and ORP.

By Volume per Analyte

A review of downward trend volume shows that analytes barium (14), boron (10), chloride (11), fluoride (12), magnesium (10), ORP (10), sulfate (13), and turbidity (12) are currently the most common exhibiting downward trends.

In terms of Appendix IV COI, there are currently (A) 7 downward trends for arsenic, (B) 8 downward trends for molybdenum and (B) 4 downward trends for lithium. The most significant of these downward trends are:

- Arsenic: GS-AP-MW-15V
- Lithium: GS-AP-MW-21, GS-AP-MW-3, GS-AP-MW-34HO
- Molybdenum: GS-AP-MW-21.

At the present, downward trends for Appendix IV COI are observed at these well locations:

- Lithium: GS-AP-MW-2, GS-AP-MW-21, GS-AP-MW-3, GS-AP-MW-36H
- Arsenic: GS-AP-MW-15V, GS-AP-MW-11R, GS-AP-MW-29H, GS-AP-MW-36H, GS-AP-MW-40H, GS-AP-MW-41HD, GS-AP-MW-7
- Molybdenum: GS-AP-MW-21, GS-AP-MW-254HA, GS-AP-MW-3, GS-AP-MW-41HS, GS-AP-MW-42H, GS-AP-MW-6V, GS-AP-MW-9V, GS-AP=PZ-18R.

Changes Relative to GWPS – First Semi-Annual Monitoring Period

The following wells showed concentration decreases to below the GWPS:

- GS-AP-MW-3: Lithium
- GS-AP-MW-15: Arsenic
- GS-AP-MW-15V: Arsenic, Lithium.

The following wells showed concentration increases above the GWPS:

- GS-AP-MW-6S: Arsenic
- GS-AP-MW-21V: Lithium
- GS-AP-MW-15V: Arsenic, Lithium.

Despite the increase, GS-AP-MW-6 has exhibited arsenic concentrations below GWPS 4 out of the most recent 5 sampling events and has shown decreasing trend.

Changes Relative to GWPS – Second Semi-Annual Monitoring Period

The following wells showed concentration decreases to below the GWPS:

- GS-AP-MW-6S: Arsenic
- GS-AP-MW-15V: Arsenic
- GS-AP-MW-21V: Lithium.

The following wells showed concentration increases above the GWPS:

- GS-AP-MW-27HR: Lithium
- GS-AP-MW-15: Arsenic
- GS-AP-MW-15V: Lithium.
- GS-AP-PZ-16: Lithium
- GS-AP-MW-29H: Lithium
- GS-AP-MW-25HA: Arsenic.

Aggregate Annual Average Trends

The following provides a summary of average annual concentrations in compliance wells (upgradient, downgradient, abandoned) since the first year of groundwater monitoring. As shown below, annualized average concentrations during 2022 for boron, arsenic, lithium, and molybdenum were the lowest since

Plant Gorgas Ash Pond
2022 Annual Groundwater Monitoring and Corrective Action Report

monitoring began. These annualized averages will continue to be evaluated and reviewed each year to determine overall trends. Averages presented below could be relational to ash pond closure activities, geochemical disequilibrium and return to equilibrium processes, and abandonment/replacement activities.

| Year | Boron (mg/L) | Arsenic (mg/L) | Lithium (mg/L) | Molybdenum (mg/L) |
|-------------|---------------------|-----------------------|-----------------------|--------------------------|
| 2016 | 0.4063 | 0.0272 | 0.0872 | 0.0259 |
| 2017 | 0.3965 | 0.0270 | 0.0923 | 0.0232 |
| 2018 | 0.3894 | 0.0265 | 0.0898 | 0.0271 |
| 2019 | 0.3267 | 0.0237 | 0.0967 | 0.0259 |
| 2020 | 0.2655 | 0.0259 | 0.1075 | 0.0337 |
| 2021 | 0.2999 | 0.0243 | 0.1119 | 0.0284 |
| 2022 | 0.2406 | 0.0193 | 0.0742 | 0.0184 |

8.0 SUMMARY AND CONCLUSIONS

Semi-annual monitoring took place in February/March and July/August 2022. Statistical evaluations of the 2022 monitoring data identified SSLs of Appendix IV constituents above the GWPS. To address previously identified SSLs, a Groundwater Remedy Selection Report was prepared and submitted to ADEM on December 16, 2021, and a Corrective Action Groundwater Monitoring Program plan on March 15, 2022. Focus on the Site now begins to shift towards planning and implementation of remedies along with continued evaluation of assessment and compliance data.

The following future actions will be taken or are recommended for the Site:

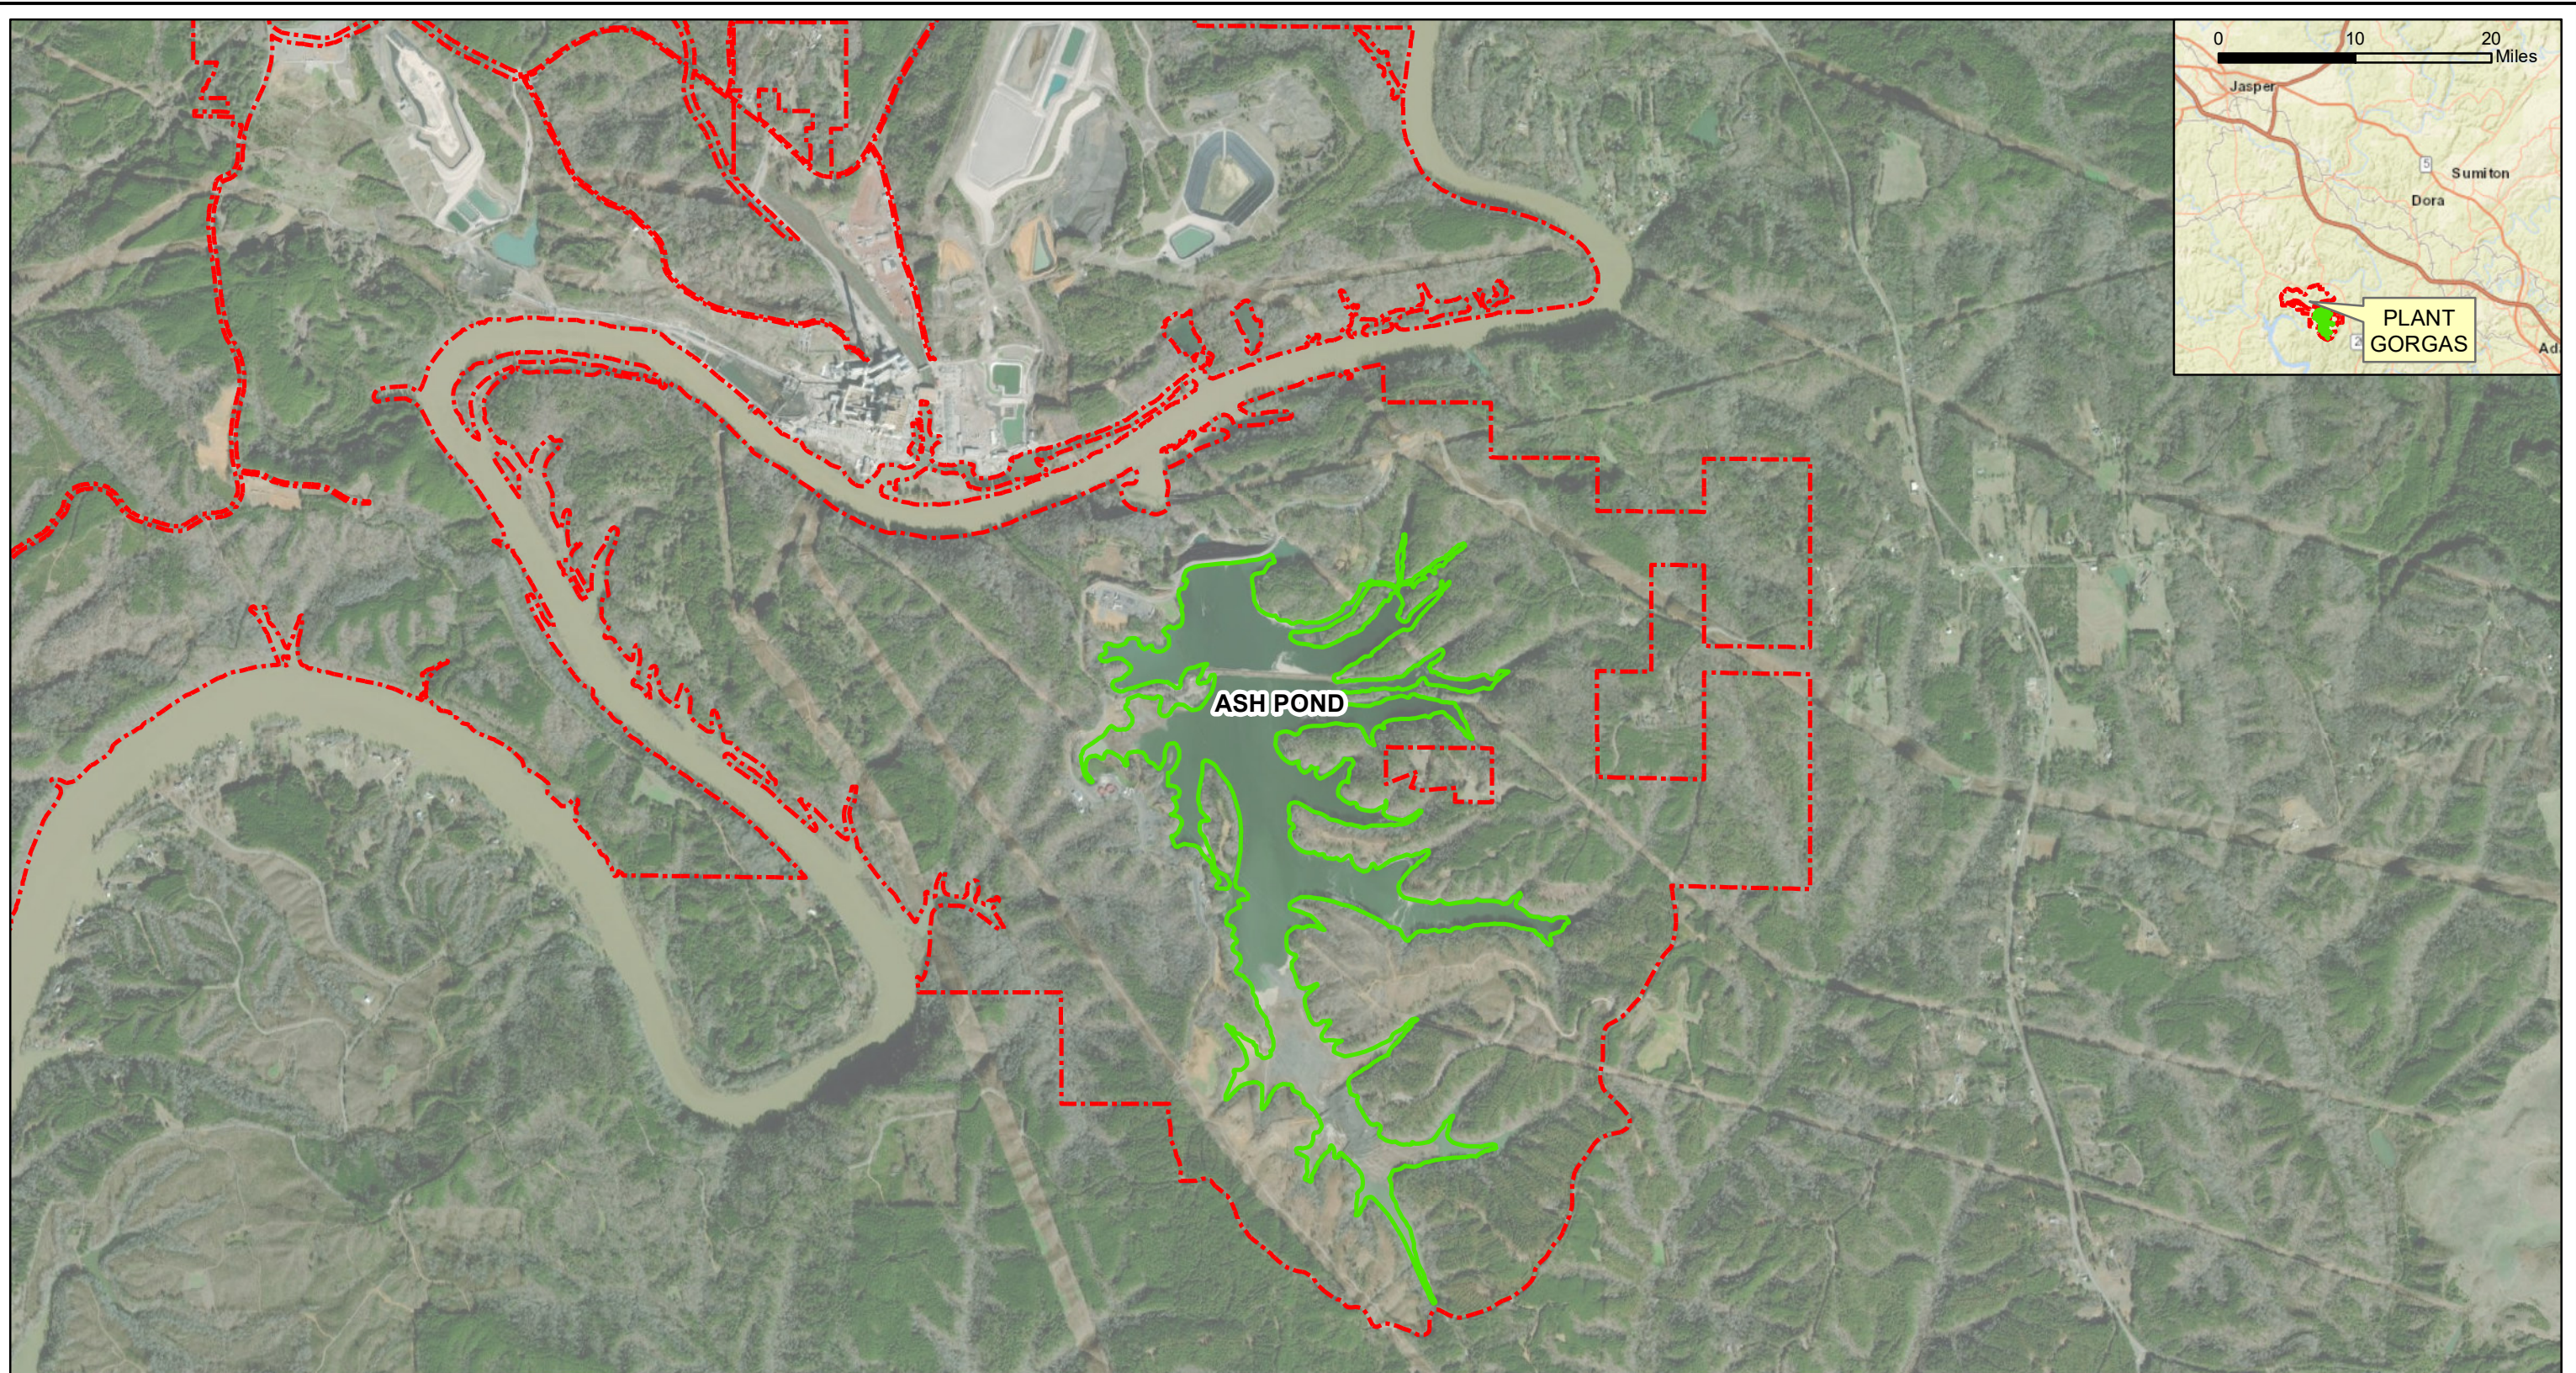

- Continue with phase 1 implementation of the Permeation Grouting Pilot Program for the remediation of arsenic, lithium, and molybdenum.
- Evaluate technical and implementation feasibility of geochemical manipulation and enhanced MNA technologies.
- Installation of near real-time instrumentation for the monitoring of potential changes in field parameter data in response to ash pond closure activities.
- Evaluation of recently collected MNA parameter data.
- Conduct the first semi-annual monitoring event and submit the semi-annual groundwater monitoring report summarizing the findings to ADEM by July 31, 2023.

5. GS-AP-MW-5, GS-AP-MW-9, GS-AP-MW-10, GS-AP-MW-11, and GS-AP-MW-14 were abandoned prior to the March 2020 event.
6. Abbreviated well and piezometer designations are shown for readability. Formal well designations are preceded by "GS-AP-" as shown on the Monitoring Well Location Map.
7. Geochemical profiles of MW-15 and MW-21 indicate potential grout contamination and do not appear to be representative of groundwater.
8. J values indicate estimated concentrations between the laboratory method detection limit and reporting limit.
9. Wells without labels are screened in aquifer zones other than Pratt or Pratt/Gillespie.

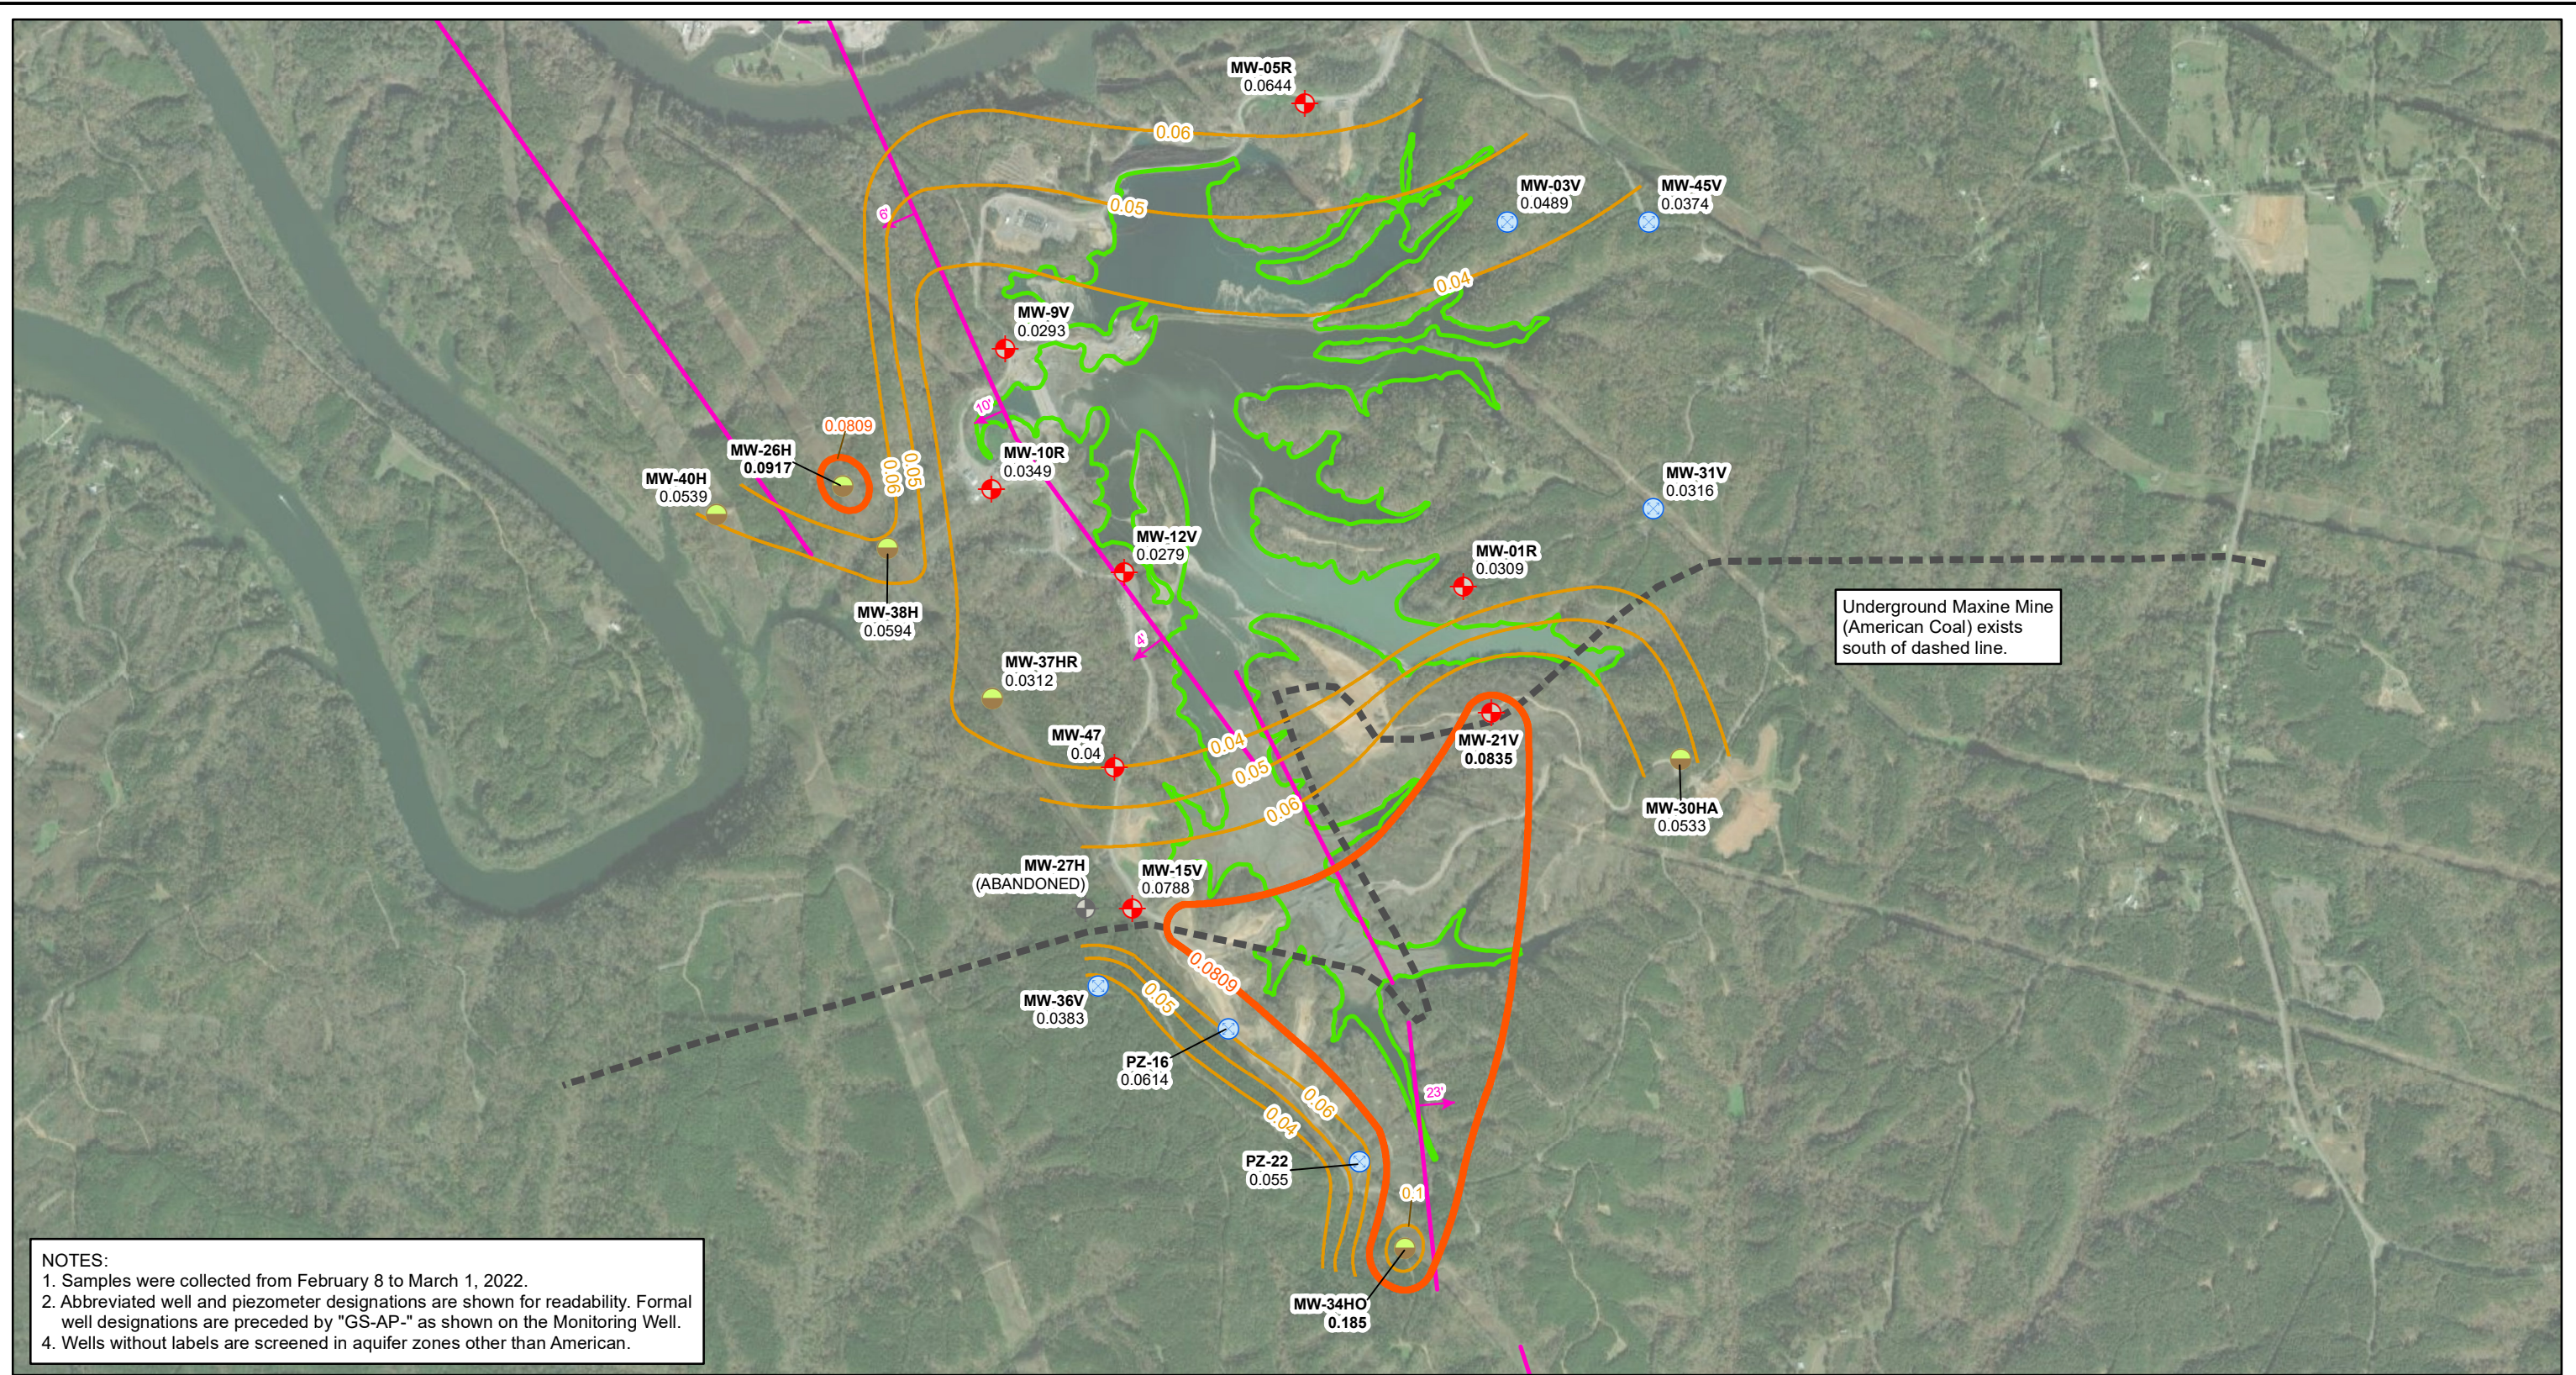

- Legend**
- Downgradient Monitoring Well
 - Upgradient Monitoring Well
 - Horizontal Delineation Well
 - Vertical Delineation Well
 - Piezometer
 - Abandoned Well
 - Lithium GWPS Background Contour (0.0809 mg/L)
 - Lithium Isoconcentration Contour (mg/L)
 - Fault
 - Dip Direction of Fault with Offset (ft)
 - Pratt Mines
 - Ash Pond Boundary

MW-19 Well ID
0.0266 Lithium Concentration (mg/L)

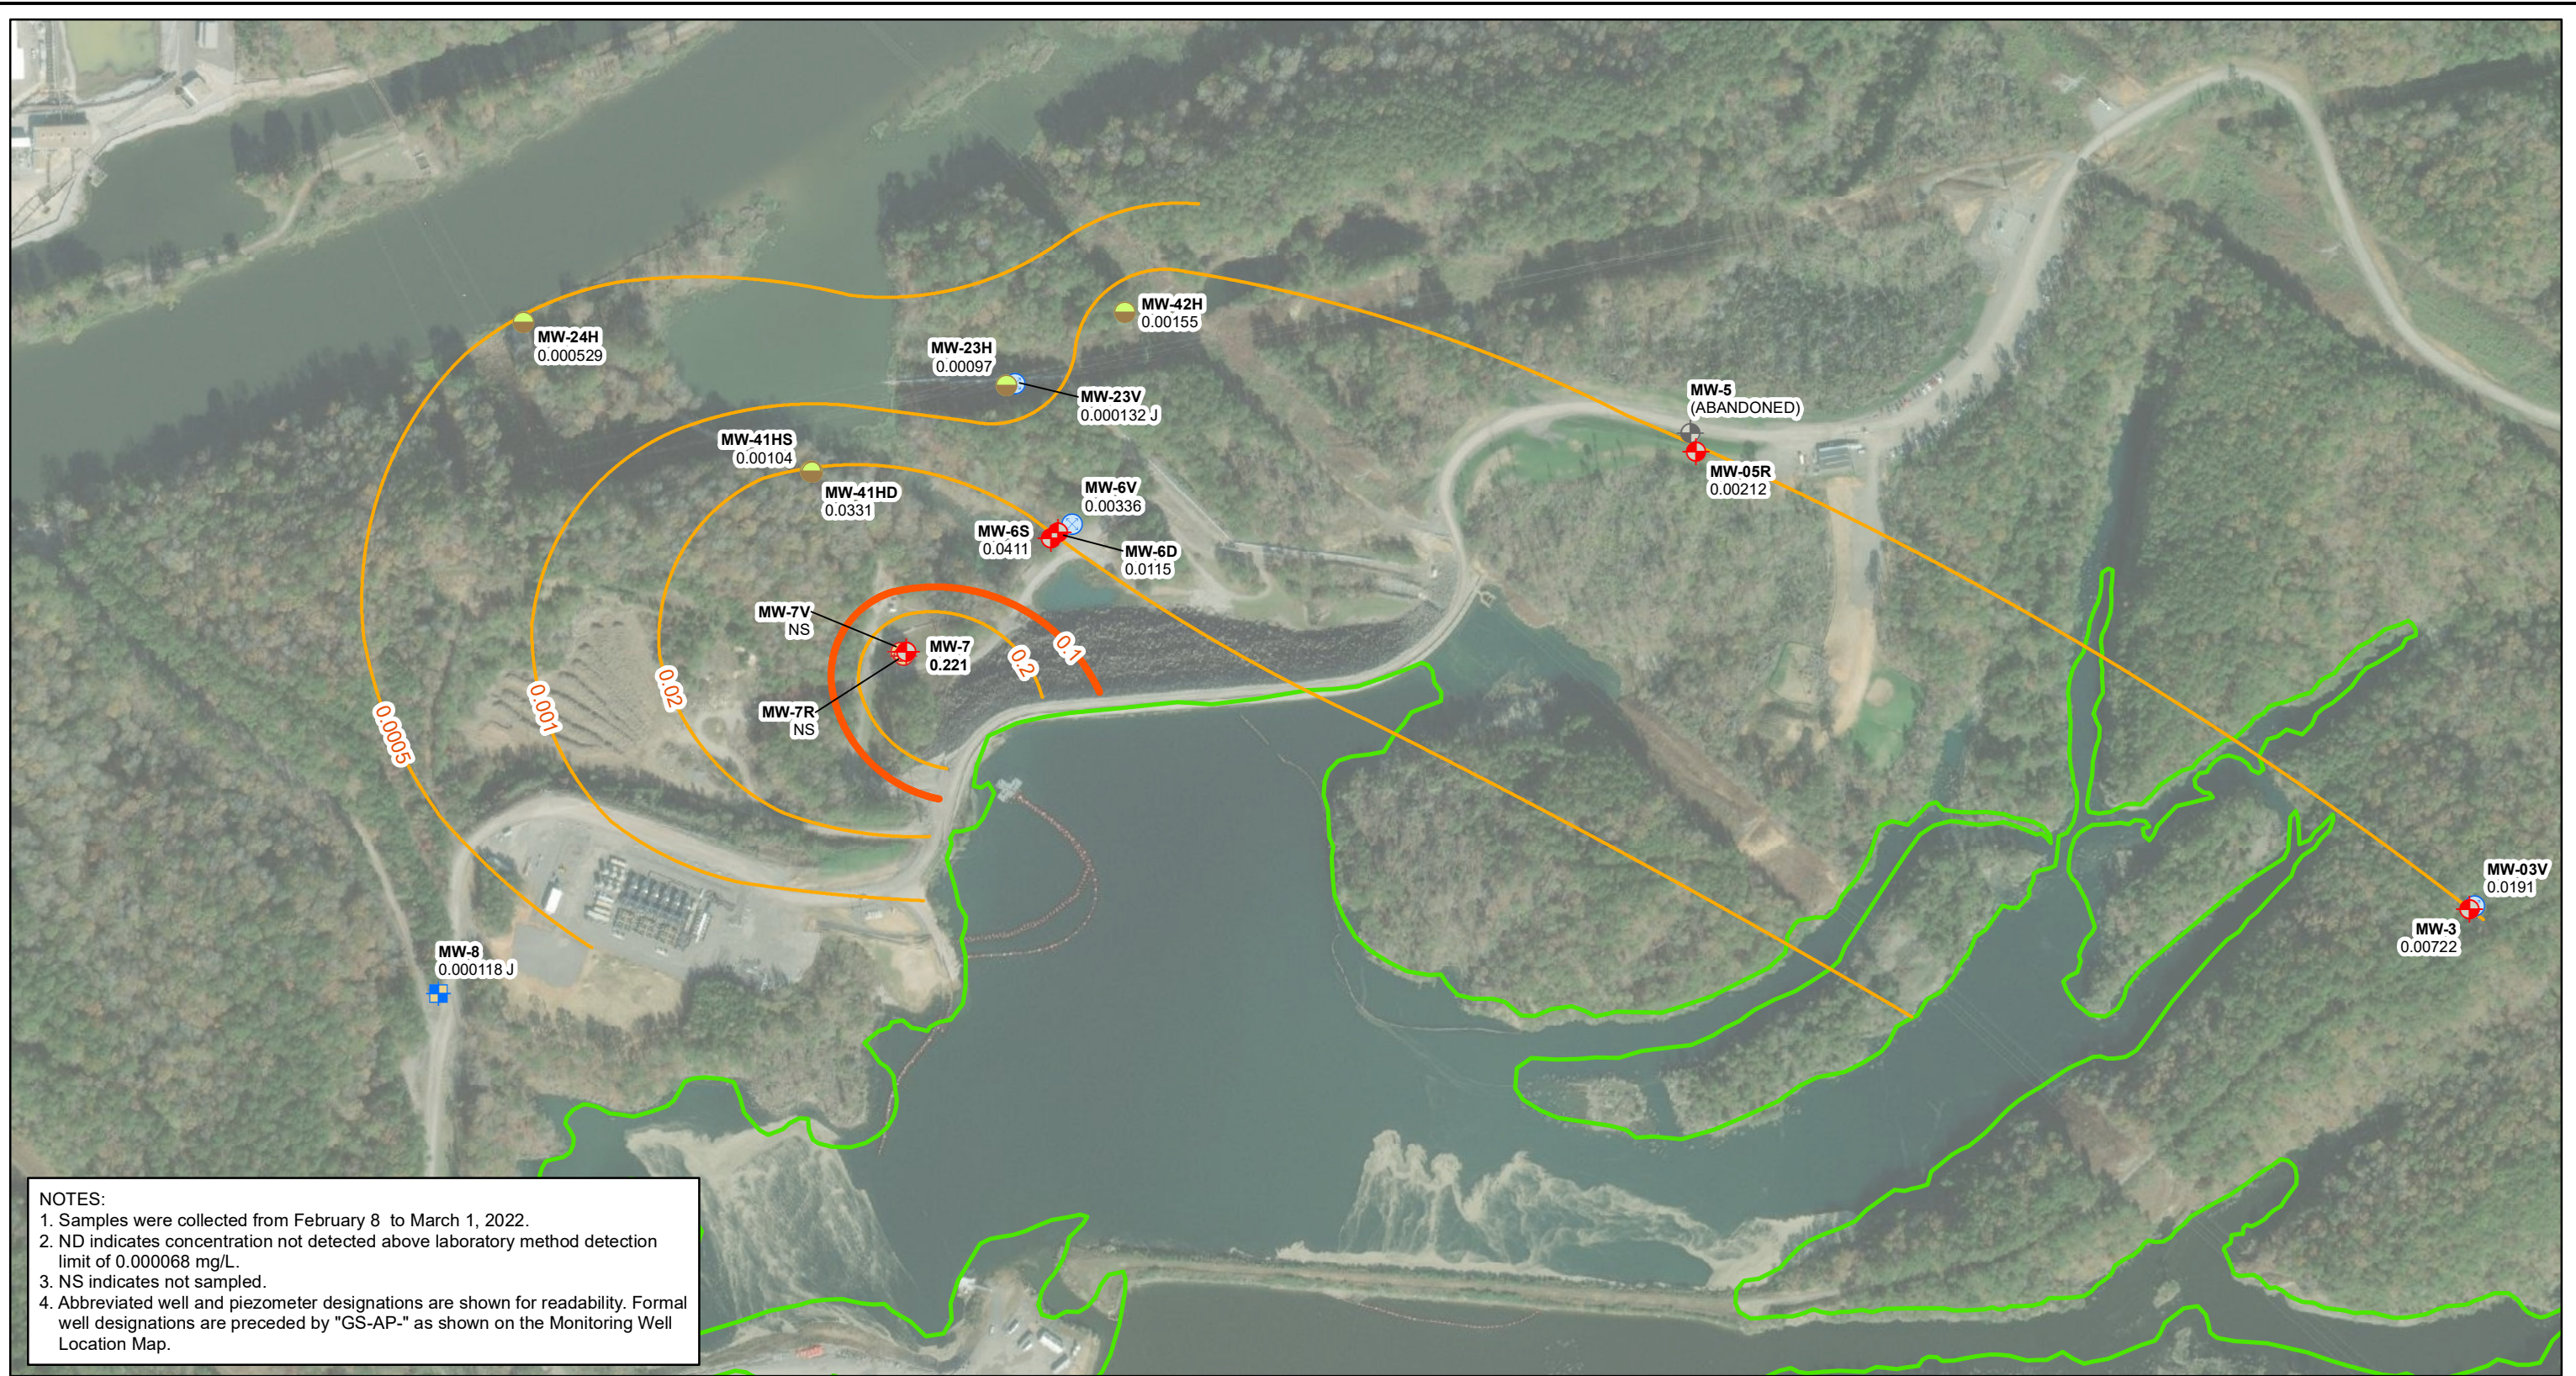

In this locale, MW-30H and MW-30SH did not yield sufficient groundwater for sampling. Deeper American Coal appears to be first productive interval (MW-30HA).

Notes:
 ft = feet; ft NAVD = elevation in feet, referenced to North American Vertical Datum; ft BTOC = depth, referenced in feet below top of casing
 (1) Coordinates have been transformed into WGS 84 from NAD 27/83, State Plane, Alabama, feet.
 (2) Vertical elevations are in feet relative to the North American Vertical Datum (NAVD) 1988.
 (3) Total well depth accounts for sump if data provided on well construction logs.

Table 2. Parameters And Reporting Limits

Plant Gorgas Ash Pond
02/08/2022 - 08/10/2022

| Appendix III Parameters | | | |
|---------------------------|--------------------------|-------------------|------------------|
| Parameters | Analytical Methods | Reporting Limits | Units of Measure |
| Boron | EPA 200.7 | 0.1015 | mg/L |
| Calcium | EPA 200.7 | 0.406-40.599998 | mg/L |
| Chloride | SM4500Cl E | 1-100 | mg/L |
| Fluoride | SM4500F G 2017 | 0.1-0.125 | mg/L |
| pH_Field | Field Sampling | NA | SU |
| Sulfate | SM4500SO4 E 2011 | 1-160 | mg/L |
| TDS | NA | NA | mg/L |
| Appendix IV Parameters | | | |
| Parameters | Analytical Methods | Reporting Limits | Units of Measure |
| Antimony | EPA 200.8 | 0.001015 | mg/L |
| Arsenic | EPA 200.8 | 0.000203 | mg/L |
| Barium | EPA 200.8 | 0.000203-0.001015 | mg/L |
| Beryllium | EPA 200.8 | 0.001015 | mg/L |
| Cadmium | EPA 200.8 | 0.000203 | mg/L |
| Chromium | EPA 200.8 | 0.001015 | mg/L |
| Cobalt | EPA 200.8 | 0.000203 | mg/L |
| Lead | EPA 200.8 | 0.000203 | mg/L |
| Lithium | EPA 200.7 | 0.02 | mg/L |
| Mercury | EPA 245.1 | 0.0005 | mg/L |
| Molybdenum | EPA 200.8 | 0.000203 | mg/L |
| Selenium | EPA 200.8 | 0.001015 | mg/L |
| Thallium | EPA 200.8 | 0.000203 | mg/L |
| Combined Radium 226 + 228 | Total Radium Calculation | 0.787-1.48 | pCi/L |

Notes:

1. Reporting Limit values can display range depending upon matrix interferences and dilution factors
2. pH is a field acquired parameter and does not have a laboratory method or reporting limit
3. Combined Radium 226 + 228 – product of radium-226 + radium-228; reporting limits presented are sum of radium 226, radium 228 reporting limits
4. EPA 200.7 – EPA methodology for the "Determination of Metals and Trace Elements in Water and Wastes by Inductively Coupled Plasma-Atomic Emission Spectrometry"
5. EPA 200.8 - EPA methodology for the "Determination of Metals and Trace Elements in Water and Wastes by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS)"
6. SM 2320, 2540, 4500 – Standard Methods for Examination of Water and Wastewater.
7. Total Radium Calculation – Term used herein for EPA 9315 + EPA 9320
8. EPA 9315 – Used for Radium-226; SW-846: Alpha-Emitting Radium Isotopes, part of Test Methods for Evaluation Solid Waste, Physical/Chemical Methods
9. EPA 9320 – Used for Radium-228; SW-846: Alpha-Emitting Radium Isotopes, part of Test Methods for Evaluation Solid Waste, Physical/Chemical Methods

| Molybdenum | mg/L | 0.00349 | 0.00328 | 6.20% |

Notes:

1. The RPD calculations presented are for analyte pairs where original and duplicate results are valid, unqualified detections.
2. RPD calculation results less than or equal to 20% are considered acceptable.
3. Results greater than 20% are given data validation flags to indicate RPD criteria failure. Communication to sampling team and lab may be necessary to explore nature of RPD failure(s).

Notes:

1. Lab qualifiers have been appended to result when applicable
2. MDL = Method Detection Limit
3. Only Appendix 4 Constituents were compared and validated. Radium data was not validated.
4. mg/L = milligrams per liter

Table 5. Summary of Background Levels and Groundwater Protection Standards

Plant Gorgas Ash Pond

| Appendix IV Analytes | | | |
|---------------------------|-------|------------|--------|
| Analyte | Units | Background | GWPS |
| Antimony | mg/L | 0.00115 | 0.006 |
| Arsenic | mg/L | 0.00214 | 0.01 |
| Barium | mg/L | 0.353 | 2 |
| Beryllium | mg/L | 0.001015 | 0.004 |
| Cadmium | mg/L | 0.000203 | 0.005 |
| Chromium | mg/L | 0.00405 | 0.1 |
| Cobalt | mg/L | 0.00362 | 0.01 |
| Fluoride | mg/L | 0.278 | 4 |
| Lead | mg/L | 0.00189 | 0.015 |
| Lithium | mg/L | 0.0809 | 0.0809 |
| Mercury | mg/L | 0.0005 | 0.002 |
| Molybdenum | mg/L | 0.00906 | 0.1 |
| Selenium | mg/L | 0.001015 | 0.05 |
| Thallium | mg/L | 0.000203 | 0.002 |
| Combined Radium 226 + 228 | pCi/L | 7.76 | 5 |

Notes:

1. mg/L - Milligrams per liter
2. pCi/L - Picocuries per liter
3. Background concentrations/limits are used when determining the groundwater protection standard (GWPS) under 40 CFR §257.95(h) and ADEM Rule 335-13-15-.06(h).
4. GWPS are generally updated on a 2 year basis which began in the Fall of 2019 (Fall 2019, Fall 2021, etc).

Notes:

- "J" indicates the result was detected above the MDL but below the PQL
- "<" indicates the result was not detected above the MDL and is considered a non-detect.
- U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
- DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
- mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
- NC = value not detected with alkalinity calculation
- Shaded cells indicate result greater than GWPS, but does not necessarily indicate an SSL.

Notes:

- "J" indicates the result was detected above the MDL but below the PQL
- "<" indicates the result was not detected above the MDL and is considered a non-detect.
- U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
- DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
- mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
- NC = value not detected with alkalinity calculation
- Shaded cells indicate result greater than GWPS, but does not necessarily indicate an SSL.

Notes:

1. "J" indicates the result was detected above the MDL but below the PQL
2. "<" indicates the result was not detected above the MDL and is considered a non-detect.
3. U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
4. DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
5. mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
6. NC = value not detected with alkalinity calculation
7. Shaded cells indicate result greater than GWPS, but does not necessarily indicate an SSL.

Notes:

1. "J" indicates the result was detected above the MDL but below the PQL
2. "<" indicates the result was not detected above the MDL and is considered a non-detect.
3. U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
4. DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
5. mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
6. NC = value not detected with alkalinity calculation
7. Shaded cells indicate result greater than GWPS, but does not necessarily indicate an SSL.

Notes:

1. "J" indicates the result was detected above the MDL but below the PQL
2. "<" indicates the result was not detected above the MDL and is considered a non-detect.
3. U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
4. DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
5. mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
6. NC = value not detected with alkalinity calculation
7. Shaded cells indicate result greater than GWPS, but does not necessarily indicate an SSL.

Analytical Results Summary Plant Gorgas Ash Pond 02/08/2022 - 05/11/2022

Notes:

- "J" indicates the result was detected above the MDL but below the PQL
- "<" indicates the result was not detected above the MDL and is considered a non-detect.
- U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
- DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
- mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
- NC = value not detected with alkalinity calculation
- Shaded cells indicate result greater than GWPS, but does not necessarily indicate an SSL.

Notes:

1. "J" indicates the result was detected above the MDL but below the PQL
2. "<" indicates the result was not detected above the MDL and is considered a non-detect.
3. U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
4. DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
5. mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
6. NC = value not detected with alkalinity calculation
7. Shaded cells indicate result greater than GWPS, but does not necessarily indicate an SSL.

Notes:

- "J" indicates the result was detected above the MDL but below the PQL
- "<" indicates the result was not detected above the MDL and is considered a non-detect.
- U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
- DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
- mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
- NC = value not detected with alkalinity calculation
- Shaded cells indicate result greater than GWPS, but does not necessarily indicate an SSL.

Notes:

- "J" indicates the result was detected above the MDL but below the PQL
- "<" indicates the result was not detected above the MDL and is considered a non-detect.
- U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
- DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
- mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
- NC = value not detected with alkalinity calculation
- Shaded cells indicate result greater than GWPS, but does not necessarily indicate an SSL.

| Horiz. Delineation | GS-AP-MW-24H | 07/27/2022 | 41.9 |
| Horiz. Delineation | GS-AP-MW-25HA | 08/03/2022 | 1.86 |

Notes:

1. "J" indicates the result was detected above the MDL but below the PQL
2. "<" indicates the result was not detected above the MDL and is considered a non-detect.
3. U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
4. DO - Dissolved Oxygen, ORP - Oxidation Reduction Potential, TDS - Total Dissolved Solids.
5. mg/L - milligrams per liter, mv - millivolts, NTU - nephelometric turbidity unit, C - celsius, SU - standard unit, uS/cm - microseimens per centimeter, pCi/L - picocuries per liter.
6. NC = value not detected with alkalinity calculation
7. Shaded cells indicate result greater than GWPS, but does not necessarily indicate an SSL.

Notes:

1. mg/L - Milligrams per Liter
2. pCi/L - picocuries per Liter
3. J - Result is an estimated value. The result is greater than or equal to the Method Detection Limit (MDL) and less than the Practical Quantitation Limit (PQL). Values are displayed as less than the PQL with a J.
4. < - Constituent was analyzed for, but was not detected above the MDL and is considered a non-detect. Value is displayed as less than the PQL.
5. Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
6. Annual sampling for Appendix IV constituents only was completed following initiation of assessment monitoring. Appendix III constituents were not required during this monitoring event.

Notes:

1. mg/L - Milligrams per Liter
2. pCi/L - picocuries per Liter
3. J - Result is an estimated value. The result is greater than or equal to the Method Detection Limit (MDL) and less than the Practical Quantitation Limit (PQL). Values are displayed as less than the PQL with a J.
4. < - Constituent was analyzed for, but was not detected above the MDL and is considered a non-detect. Value is displayed as less than the PQL.
5. Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
6. Annual sampling for Appendix IV constituents only was completed following initiation of assessment monitoring. Appendix III constituents were not required during this monitoring event.

Notes:

1. mg/L - Milligrams per Liter
2. pCi/L - picocuries per Liter
3. J - Result is an estimated value. The result is greater than or equal to the Method Detection Limit (MDL) and less than the Practical Quantitation Limit (PQL). Values are displayed as less than the PQL with a J.
4. < - Constituent was analyzed for, but was not detected above the MDL and is considered a non-detect. Value is displayed as less than the PQL.
5. Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
6. Annual sampling for Appendix IV constituents only was completed following initiation of assessment monitoring. Appendix III constituents were not required during this monitoring event.

Notes:

1. mg/L - Milligrams per Liter
2. pCi/L - picocuries per Liter
3. J - Result is an estimated value. The result is greater than or equal to the Method Detection Limit (MDL) and less than the Practical Quantitation Limit (PQL). Values are displayed as less than the PQL with a J.
4. < - Constituent was analyzed for, but was not detected above the MDL and is considered a non-detect. Value is displayed as less than the PQL.
5. Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
6. Annual sampling for Appendix IV constituents only was completed following initiation of assessment monitoring. Appendix III constituents were not required during this monitoring event.

Notes:

1. mg/L - Milligrams per Liter
2. pCi/L - picocuries per Liter
3. J - Result is an estimated value. The result is greater than or equal to the Method Detection Limit (MDL) and less than the Practical Quantitation Limit (PQL). Values are displayed as less than the PQL with a J.
4. < - Constituent was analyzed for, but was not detected above the MDL and is considered a non-detect. Value is displayed as less than the PQL.
5. Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
6. Annual sampling for Appendix IV constituents only was completed following initiation of assessment monitoring. Appendix III constituents were not required during this monitoring event.

Notes:

1. mg/L - Milligrams per Liter
2. pCi/L - picocuries per Liter
3. J - Result is an estimated value. The result is greater than or equal to the Method Detection Limit (MDL) and less than the Practical Quantitation Limit (PQL). Values are displayed as less than the PQL with a J.
4. < - Constituent was analyzed for, but was not detected above the MDL and is considered a non-detect. Value is displayed as less than the PQL.
5. Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
6. Annual sampling for Appendix IV constituents only was completed following initiation of assessment monitoring. Appendix III constituents were not required during this monitoring event.

Notes:

1. mg/L - Milligrams per Liter
2. pCi/L - picocuries per Liter
3. J - Result is an estimated value. The result is greater than or equal to the Method Detection Limit (MDL) and less than the Practical Quantitation Limit (PQL). Values are displayed as less than the PQL with a J.
4. < - Constituent was analyzed for, but was not detected above the MDL and is considered a non-detect. Value is displayed as less than the PQL.
5. Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
6. Annual sampling for Appendix IV constituents only was completed following initiation of assessment monitoring. Appendix III constituents were not required during this monitoring event.

Notes:

1. mg/L - Milligrams per Liter
2. pCi/L - picocuries per Liter
3. J - Result is an estimated value. The result is greater than or equal to the Method Detection Limit (MDL) and less than the Practical Quantitation Limit (PQL). Values are displayed as less than the PQL with a J.
4. < - Constituent was analyzed for, but was not detected above the MDL and is considered a non-detect. Value is displayed as less than the PQL.
5. Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
6. Annual sampling for Appendix IV constituents only was completed following initiation of assessment monitoring. Appendix III constituents were not required during this monitoring event.

Notes:

1. mg/L - Milligrams per Liter
2. pCi/L - picocuries per Liter
3. J - Result is an estimated value. The result is greater than or equal to the Method Detection Limit (MDL) and less than the Practical Quantitation Limit (PQL). Values are displayed as less than the PQL with a J.
4. < - Constituent was analyzed for, but was not detected above the MDL and is considered a non-detect. Value is displayed as less than the PQL.
5. Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
6. Annual sampling for Appendix IV constituents only was completed following initiation of assessment monitoring. Appendix III constituents were not required during this monitoring event.

Notes:

1. mg/L - Milligrams per Liter
2. pCi/L - picocuries per Liter
3. J - Result is an estimated value. The result is greater than or equal to the Method Detection Limit (MDL) and less than the Practical Quantitation Limit (PQL). Values are displayed as less than the PQL with a J.
4. < - Constituent was analyzed for, but was not detected above the MDL and is considered a non-detect. Value is displayed as less than the PQL.
5. Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
6. Annual sampling for Appendix IV constituents only was completed following initiation of assessment monitoring. Appendix III constituents were not required during this monitoring event.

Notes:

1. mg/L - Milligrams per Liter
2. pCi/L - picocuries per Liter
3. J - Result is an estimated value. The result is greater than or equal to the Method Detection Limit (MDL) and less than the Practical Quantitation Limit (PQL). Values are displayed as less than the PQL with a J.
4. < - Constituent was analyzed for, but was not detected above the MDL and is considered a non-detect. Value is displayed as less than the PQL.
5. Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
6. Annual sampling for Appendix IV constituents only was completed following initiation of assessment monitoring. Appendix III constituents were not required during this monitoring event.

| Appendix IV | | | | | | | | | | | | |
| Selenium | mg/L | <0.002 | <0.002 | <0.002 | <0.002 | <0.002 | -- | <0.002 | <0.002 | <0.002 | <0.002 | <0.002 |
| Thallium | mg/L | <0.0002 | <0.0002 | <0.0002 | <0.0002 | <0.0002 | -- | <0.0002 | <0.0002 | <0.0002 | <0.0002 | <0.0002 |

Notes:

1. mg/L - Milligrams per Liter
2. pCi/L - picocuries per Liter
3. J - Result is an estimated value. The result is greater than or equal to the Method Detection Limit (MDL) and less than the Practical Quantitation Limit (PQL). Values are displayed as less than the PQL with a J.
4. < - Constituent was analyzed for, but was not detected above the MDL and is considered a non-detect. Value is displayed as less than the PQL.
5. Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
6. Annual sampling for Appendix IV constituents only was completed following initiation of assessment monitoring. Appendix III constituents were not required during this monitoring event.

4. < - Constituent was analyzed for, but was not detected above the MDL and is considered a non-detect. Value is displayed as less than the PQL.
5. Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
6. Annual sampling for Appendix IV constituents only was completed following initiation of assessment monitoring. Appendix III constituents were not required during this monitoring event.

| Thallium | mg/L | <0.0002 | <6.8e-005 | <6.8e-005 | <6.8e-005 | <6.8e-005 | <0.0002 | <0.0002 | <0.0002 | <0.0002 | <6.8e-005 | <6.8e-005 |

Notes:

1. mg/L - Milligrams per Liter
2. pCi/L - picocuries per Liter
3. J - Result is an estimated value. The result is greater than or equal to the Method Detection Limit (MDL) and less than the Practical Quantitation Limit (PQL). Values are displayed as less than the PQL with a J.
4. < - Constituent was analyzed for, but was not detected above the MDL and is considered a non-detect. Value is displayed as less than the PQL.
5. Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
6. Annual sampling for Appendix IV constituents only was completed following initiation of assessment monitoring. Appendix III constituents were not required during this monitoring event.

1. mg/L - Milligrams per Liter
2. pCi/L - picocuries per Liter
3. J - Result is an estimated value. The result is greater than or equal to the Method Detection Limit (MDL) and less than the Practical Quantitation Limit (PQL). Values are displayed as less than the PQL with a J.
4. < - Constituent was analyzed for, but was not detected above the MDL and is considered a non-detect. Value is displayed as less than the PQL.
5. Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
6. Annual sampling for Appendix IV constituents only was completed following initiation of assessment monitoring. Appendix III constituents were not required during this monitoring event.

ANALYTICAL DATA SUMMARY
Ash Pond (08/01/2016 - 08/10/2022)
APC Plant Gorgas
Walker County Alabama

Appendix C

Gorgas Ash Pond

2022 Compliance Event 1

All samples were collected using methods defined in Alabama Power's Water Field Group Low-Flow Groundwater Sampling Procedure and the associated site-specific Sampling and Analysis Plan (SAP).

Turbidity levels less than 10 NTU were not able to be achieved after extended pumping for well MW-7. A complete sample set for totals analysis was collected followed by a field filtered set for dissolved analysis.

Due to low yield, well MW-32H was sampled using the Minimal Purge Method, as defined in the SAP.

Four of the first few pH field readings for well MW-12 were qualified due to pH readings falling outside of the bracketed calibration range. The below qualifier was used:

- E – Estimated reported value exceeded calibration range

Dusty conditions due to high winds and vehicle traffic were present when pumping and sampling wells MW-30HA and MW-34HO.

Suspected iron bacteria was present during initial pumping of well MW-41HS.

Rainy conditions were present when pumping and sampling wells MW-43H, PZ-18R, MW-36V, MW-45V, MW-9V, MW-31V and MW-01R.

Field quality control procedures were performed as follows:

- Blanks and Sample Duplicates were collected as described in the SAP.
- Calibration verifications for all required field parameters were performed daily, before and after sample collection.

April 13, 2022

Dear Dustin Brooks,

Enclosed are the analytical results for sample(s) received by the laboratory between February 09, 2022 and March 01, 2022. All results reported herein conform to the laboratory's most current Quality Assurance Manual. Results marked with an asterisk conform to the most current applicable TNI/NELAC requirements. Exceptions will be noted in the body of the report.

Laboratory certification ID: E571114
Issued By: State of Florida, Department of Health
Expiration: June 30, 2022

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Quality Control: **Laura Midkiff** Digitally signed by Laura Midkiff

4. All of the above samples were analyzed by EPA 200.7 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed, and all criteria were met.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were analyzed, and all criteria were met.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- All calibration curve requirements were within acceptance criteria.
- All sample internal standard criteria were met.
- The spectral interference check associated with EPA 200.7 was analyzed, and all acceptance criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for accuracy were met, except for the following:
 - BC02838, BC03245, BC03528, & BC03962 Sodium MS/MSD spike levels were <30% of the sample concentrations.
 - BC04384 Sodium & Silicon MS/MSD spike levels were <30% of the sample concentrations.
 - BC04386 Calcium, Sodium, & Magnesium MS/MSD spike levels were <30% of the sample concentrations.
- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for precision were met.

7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

| <u>Sample ID</u> | <u>Analyte</u> | <u>Dilution Factor</u> |
|------------------|----------------------------|------------------------|
| BC02831 | Sodium | 10.15 |
| BC02834 | Sodium | 10.15 |
| BC02835 | Calcium, Sodium | 10.15 |
| BC02836 | Sodium | 10.15 |
| BC02837 | Sodium | 20.3 |

4. All of the above samples were analyzed and prepared by EPA 200.7 for dissolved analysis.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed, and all criteria were met.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were analyzed, and all criteria were met.
- Due to no filtered method blank (MB) or laboratory control sample (LCS) submitted with the sample set, an unfiltered MB and LCS were analyzed with the samples in each batch.
- All laboratory control sample criteria were met.
- The method blank associated with each batch passed all acceptance criteria for all requested analytes.
- All calibration curve requirements were within acceptance criteria.
- All sample internal standard criteria were met.
- The spectral interference check associated with EPA 200.7 was analyzed and all acceptance criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were analyzed with each ICP batch. All acceptance criteria for accuracy were met, except for the following:
 - BC02838 Sodium & Silicon MS/MSD spike levels were <30% of the sample concentrations.
 - BC03245 & BC03955 Sodium MS/MSD spike levels were <30% of the sample concentrations.
 - BC03530 & BC04386 Calcium MS/MSD spike levels were <30% of the sample concentrations.
 - BC03966 Sodium and Calcium MS/MSD spike levels were <30% of the sample concentrations.
- A matrix spike and matrix spike duplicate were analyzed with each ICP batch. All acceptance criteria for precision were met.

7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

| <u>Sample ID</u> | <u>Analyte</u> | <u>Dilution Factor</u> |
|------------------|----------------------------|------------------------|

4. All of the above samples were analyzed by EPA 200.8 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All tune and calibration met criteria for all requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- The interference check samples associated with EPA 200.8 were analyzed and passed for all requested analytes.
- All sample internal standard criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for accuracy were met, except for the following:
 - BC03532 Barium MS/MSD spike levels were <30% of the sample concentrations.
 - BC03973 Aluminum MS/MSD recoveries were outside of the specification limits. The sample bottle had visible sediment. Matrix issue is suspected.
- A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for precision were met.

7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

| <u>Sample ID</u> | <u>Analyte</u> | <u>Dilution Factor</u> |
|------------------|----------------|------------------------|
| BC03240 | Manganese | 10.15 |
| BC03241 | Manganese | 10.15 |
| BC03243 | Manganese | 10.15 |
| BC03244 | Manganese | 10.15 |
| BC03525 | Aluminum | 10.15 |
| BC03968 | Barium | 5.075 |

8. The raw data results are shown with dilution factors included.

4. All of the above samples were analyzed and prepared by EPA 200.8 for dissolved analysis.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All tune and calibration met criteria for all requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- Due to no filtered method blank (MB) or laboratory control sample (LCS) submitted with the sample set, an unfiltered MB and LCS were analyzed with the samples in each batch.
- All laboratory control sample criteria were met.
- The method blank associated with each preparation batch passed all acceptance criteria for all requested analytes.
- The interference check samples associated with EPA 200.8 were analyzed and passed for all requested analytes.
- All sample internal standard criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. 4. All of the above samples were analyzed and prepared by EPA 245.1.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the method detection limit for the requested analyte.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analyte.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analyte.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch was below the limit of quantitation for the requested analyte.
- All calibration met criteria for the requested analyte.
- All response signals were satisfactory.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each analytical batch. All acceptance criteria for accuracy were met.
- A matrix spike and matrix spike duplicate were digested and analyzed with each analytical batch. All acceptance criteria for precision were met.

7. All samples were analyzed without a dilution.

4. All of the above samples were prepared and analyzed by Standard Method 2540C.
5. All samples were prepared and analyzed within the established hold times, except for the following:
 - a. BC03534 was originally analyzed within hold time. Upon data review, an analytical error was discovered. The sample was rerun in a separate batch (719591) out of hold time.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- A Method Blank was analyzed with each batch. All criteria were met.
- All final weights of samples, standards, and blanks agreed within 0.5mg of the previous weight.
- A sample duplicate was analyzed with each batch, and RPD was $\leq 10\%$, except for the following:
 - Batch 719591 was analyzed without a sample duplicate.
- A laboratory control sample was analyzed with each batch. All criteria were met.
- Samples were between 2.5mg and 200mg residue.
- All samples with residue $< 2.5\text{mg}$ had the maximum volume of 150mL filtered. Affected samples are as follows:
 - BC03248
 - BC03526
 - BC03538
 - BC03957
 - BC03969
 - BC03972
 - BC04383

4. All of the above samples were analyzed and prepared by SM4500 Cl E, SM4500 F G, and SM4500 SO4 E.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All calibration met criteria for the requested analyte.
- Prior to sample analysis, an initial calibration verification (ICV), and all criteria were met.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for the requested analyte.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analyte.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analyte.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike was analyzed with each batch. Acceptance criteria for accuracy was met, except for the following:
 - BC04386 Sulfate matrix spike recovery was outside of the specification limit.
 - A sample duplicate was analyzed with each batch. Acceptance criteria for precision were met, except for the following:
 - BC04386 Fluoride precision was invalid due to sample concentration.
7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

| BC04385 | 720329 & 720330 | WMWGORAP_1350 |
| BC04386 | 720329 & 720330 | WMWGORAP_1350 |

4. All of the above samples were prepared and analyzed by Standard Method 2320B.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- An initial pH check was analyzed with each batch. The acceptance criteria were met.
- A final pH check was analyzed with each batch. The acceptance criteria were met.
- An alkalinity laboratory control sample was analyzed with each batch. Range criteria of within 10% of true value was met.
- An alkalinity sample duplicate was analyzed with each batch. Precision criteria less than 10 RPD was met.

7. The following samples had $\text{pH} > 10$ and/or $\text{TDS} > 500 \text{mg/L}$. Therefore, the calculations for carbonate and bicarbonate are estimates:

- BC02834
- BC02835
- BC02836
- BC02837
- BC03239
- BC03243
- BC03244
- BC03527
- BC03528
- BC03529
- BC03533
- BC03535
- BC03953
- BC03956
- BC03961
- BC03962
- BC03971
- BC03973
- BC04386

8. The following sample had $\text{pH} > 12$. Therefore, the calculations for carbonate and bicarbonate are invalid and not reported:

- BC03525

Nitrate-Nitrite

Gorgas Ash Pond

WMWGORAP_1350

1. This report consists of all MWs and corresponding Lab IDs listed on the Chain of Custody.
2. Refer to comments on Chain of Custody for information regarding sample receipt.
3. All standards and solutions meet NELAP traceability requirements and were used within their recommended shelf life.

4. All of the above samples were prepared and analyzed for NO_x by EPA 353.2.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Water baseline report was run and met criteria.
- All calibration met criteria for the requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and met all criteria.
- All continued calibration verification (CCV) were within the acceptance criteria.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and were below limit of detection.
- All continued calibration blanks (CCB) were below the limit of detection.

EPA 353.2 Specific QC:

- Prior to sample analysis, Cadmium coil reduction efficiency check met criteria.
- Matrix Specific QC:
 - A sample duplicate was run and criteria for precision was met.
 - A matrix spike was run and criteria for accuracy was met, except for the following:
 - BC03245 & BC03538 MS were outside of the specification limit.

7. All samples were analyzed without a dilution factor.
8. The raw data results are shown with dilution factors included.

4. All of the above samples were prepared and analyzed by Standard Method 5310B.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All calibration criteria were met.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and met all criteria.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and was $<1/2RL$.
- All continued calibration verifications (CCVs) were within the acceptance range.
- All continued calibration blanks (CCBs) were $<1/2RL$.

Matrix Specific Quality Control Procedures:

- A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for accuracy were met.
 - A matrix spike and matrix spike duplicate were analyzed with each batch. All acceptance criteria for precision were met.
7. All samples were analyzed without a dilution factor.
 8. The raw data results are shown with dilution factors included.

Comments: The client submitted filtered samples for dissolved analysis, but no MB or LCS were submitted. Therefore, dissolved data is qualified. When Alkalinity was performed, the pH reading was above 12SU. Therefore, bicarbonate and carbonate calculations are invalid and not reported.

MDL's and RL's are adjusted for sample dilution, as applicable

Comments: The client submitted filtered samples for dissolved analysis, but no MB or LCS were submitted. Therefore, dissolved data is qualified. The sample was originally analyzed in hold time for TDS. Upon data review, an analytical error was discovered. The sample was rerun in a separate batch out of hold time with no sample duplicate.

Comments: The client submitted filtered samples for dissolved analysis, but no MB or LCS were submitted. Therefore, dissolved data is qualified. The sample was originally analyzed in hold time for TDS. Upon data review, an analytical error was discovered. The sample was rerun in a separate batch out of hold time with no sample duplicate.

Comments: The client submitted filtered samples for dissolved analysis, but no MB or LCS were submitted. Therefore, dissolved data is qualified.

Batch QC Summary

Customer Account: WMWGORAP

Sample Date: 2/23/22 13:33

Customer ID:

Delivery Date: 2/23/22 16:56

Description: Gorgas Ash Pond - MW-23V

Laboratory ID Number: BC03973

| Sample | Analysis | Units | MB | MB Limit | Spike | MS | Sample Duplicate | Standard | Standard Limit | Rec | Rec Limit | Prec | Prec Limit |
